Smart Materials for Waste Water Applications Ajay Kumar Mishra,2016-01-29 Smart materials are used to develop more cost effective and high performance water treatment systems as well as instant and continuous ways to monitor water quality Smart materials in water research have been

extensively utilized for the treatment remediation and pollution prevention Smart materials can maintain the long term water quality availability and viability of water resource Thus water via smart materials can be reused recycled desalinized and also it can detect the biological and chemical contamination whether the source is from municipal industrial or man made waste The 15 state of the art review chapters contained in this book cover the recent advancements in the area of waste water as well as the prospects about the future research and development of smart materials for the waste water applications in the municipal industrial and manmade waste areas Treatment techniques nanofiltration ultrafiltration reverse osmosis adsorption and nano reactive membranes are also covered in depth The chapters are divided into three groups The first section includes the various carbon nanomaterials such as carbon nanotubes mixed oxides with a focus on use of carbon at nanoscale applied for waste water research The second section focuses on synthetic nanomaterials for pollutants removal The third section highlights the bio polymeric nanomaterials where the authors have used the natural polymers matrices in a composite and nanocomposite material for waste treatment The large number of researchers working in the area will benefit from the fundamental concepts advanced approaches and application of the various smart materials towards waste water treatment that are described in the book It will also provide a platform for the researchers and graduate students to carry out advanced research and understand the building blocks
