Venable, 1974 **The Optical Journal and Review of Optometry** , 1924 *Dynamics of Visual Motion Processing* Guillaume S. Masson, Uwe J. Ilg, 2009-12-02 Motion processing is an essential piece of the complex brain machinery that allows us to reconstruct the 3D layout of objects in the environment to break camouflage to perform scene segmentation to estimate the ego movement and to control our action Although motion perception and its neural basis have been a topic of intensive research and modeling the last two decades recent experimental evidences have stressed the dynamical aspects of motion integration and segmentation This book presents the most recent approaches that have changed our view of biological motion processing These new experimental evidences call for new models emphasizing the collective dynamics of large population of neurons rather than the properties of separate individual filters Chapters will stress how the dynamics of motion processing can be used as a general approach to understand the brain dynamics itself **Color Vision** Werner G. Space Sense provides a well integrated and authoritative account of the physiology of the eye The book is organized into two parts Part I on visual optics begins with a discussion of the branches of optics and the basic principles of geometrical optics This is followed by separate chapters on refraction at plane and spherical surfaces the thin spherical lens in air reflexion at plane and spherical surfaces the astigmatic lens aberrations of optical images ametropia and its correction and retinoscopy and ophthalmoscopy Part II on the optical space sense includes discusses of objective and subjective space spatial localization according to direction perception of distance and of size spatial localization through binocular vision special topics in binocular spatial localization and ocular dominance and binocular retinal rivalry Whilst the emphasis has been on readability rather than exhaustiveness the various accounts are sufficiently well documented to make the treatise valuable not only to teachers in physiology psychology and ophthalmology but also to research workers in all branches of ocular physiology

Neuronal Coding of Perceptual Systems Werner Backhaus,2001 Neuronal coding of information coming from external and internal environments and transduced by sensory receptors constitutes a basic biophysical problem After the coding phase such information orients organism responses shaping complex behavioural patterns The characteristics of both neurons interneurons with re entering connections latency times filter bandwidth with respect to input signals logic operations on multiple convergent signals and neuron nets reverberating nets feedback feed forward connections oscillations due to endogenous activity patterns are important for coding mechanisms Neuronal coding is implied also in the higher phases of information processing linked to consciousness when neuronal activity patterns are related to perceptual mental representations
