

HOW HELICOPTER WORK

MAIN ROTOR

The main rotor is the primary lifting device of the helicopter. It consists of a central hub with several blades attached. The blades are connected to the hub by a system of hinges, which allow them to flap up and down as the helicopter moves forward. This flapping action creates a difference in lift between the advancing and retreating blades, which allows the helicopter to maintain a steady altitude.

TAIL ROTOR

The tail rotor is a smaller rotor located at the rear of the helicopter. Its primary function is to counteract the torque produced by the main rotor, which would otherwise cause the helicopter to spin around its vertical axis. The tail rotor is connected to the main rotor's drive shaft by a system of gears and belts.
