Hydrothermal Processes Above the Yellowstone Magma Chamber Lisa A. Morgan,Wayne C. Shanks,Kenneth Lee Pierce,2009-01-01 Home to more than 10 000 thermal features Yellowstone has experienced over 20 large hydrothermal explosions producing craters from 100 to over 2500 meters in diameter during the past 16 000 years Using new mapping sampling and analysis techniques this volume documents a broad spectrum of ages and geologic settings for these events and considers additional processes and alternative triggering mechanisms that have not been explored in previous studies Although large hydrothermal explosions are rare on the human time scale the potential for future explosions in Yellowstone is not insignificant and events large enough to create a 100 m wide crater might be expected every 200 years This work presents information useful for determining the timing distribution and possible causes of these events in Yellowstone which will aid in the planning of monitoring strategies and the anticipation of hydrothermal explosions Publisher s description

Geothermal Water Management Jochen Bundschuh, Barbara Tomaszewska, 2018-03-12

Availability of and adequate accessibility to freshwater and energy are two key technological and scientific problems of global significance At the end of the 20th century the deficit of water for human consumption and economic application forced us to focus on rational use of resources Increasing the use of renewable energy sources and improving energy efficiency is a challenge for the 21st century Geothermal energy is heat energy generated and stored in the Earth accumulated in hydrothermal systems or in dry rocks within the Earth s crust in amounts which constitute the energy resources The sustainable management of geothermal energy resources should be geared towards optimization of energy recovery but also towards rational management of water resources since geothermal water serves both as energy carrier and also as valuable raw material Geothermal waters depending on their hydrogeothermal characteristics the lithology of the rocks involved the depth at which the resources occur and the sources of water supply may be characterized by very diverse physicochemical parameters This factor largely determines the technology to be used in their exploitation and the way the geothermal water can be used This book is focused on the effective use of geothermal water and renewable energy for future

needs in order to promote modern sustainable and effective management of water resources The research field includes crucial new areas of study an improvement in the management of freshwater resources through the use of residual geothermal water a review of the technologies available in the field of geothermal water treatment for its re use for energetic purposes and freshwater production and the development of balneotherapy The book is aimed at professionals academics and decision makers worldwide water sector representatives and administrators business enterprises specializing in renewable energy management and water treatment working in the areas of geothermal energy usage water resources water supply and energy planning This book has the potential to become a standard text used by educational institutions and research development establishments involved in the geothermal water management

rapid ejection of boiling water steam mud and rock fragments from source craters that range from a few meters up to more than 2 km in diameter associated breccia can be emplaced as much as 3 to 4 km from the largest craters Hydrothermal explosions occur where shallow interconnected reservoirs of steam and liquid saturated fluids with temperatures at or near the boiling curve underlie thermal fields Sudden reduction in confining pressure causes fluids to flash to steam resulting in significant expansion rock fragmentation and debris ejection In Yellowstone hydrothermal explosions are a potentially significant hazard for visitors and facilities and can damage or even destroy thermal features The breccia deposits and associated craters formed from hydrothermal explosions are mapped as mostly Holocene the Mary Bay deposit is older units throughout Yellowstone National Park YNP and are spatially related to within the 0.64 Ma Yellowstone caldera and along the active Norris Mammoth tectonic corridor *Geothermal Resources Council Bulletin* Geothermal Resources Council, 1991
