Identification Of Dark Matter:

The Identification of Dark Matter Neil J. C. Spooner, Vitaly Kudryavtsev, 2001 The objective of the workshop series The Identification of Dark Matter is to assess critically the status of work attempting to identify what constitutes dark matter in particular to consider what techniques are currently being used how successful they are and what new techniques are likely to improve the prospects for identifying dark matter candidates in the future This proceedings volume includes reviews on major particle astrophysics topics in the field of dark matter as well as short contributed papers *Identification Of Dark Matter, The - Proceedings Of The First International Workshop* Neil J C Spooner, 1997-08-02 There can be little doubt now that 90 99% of the Universe comprises dark matter Hence it is of critical importance now not just to pursue further evidence for its existence but rather to identify what the dark matter is Assessment of progress in this area was the objective of the first International Workshop on the Identification of Dark Matter in particular to consider what techniques both observational and experimental are currently being used how successful they are now and what new techniques will improve the prospects of identifying the likely candidates The meeting included reviews on major particle astrophysics topics in dark matter but was largely devoted to short contributed talks on new work in the field This book is the written proceedings of the meeting

Mathematics of Particle-Wave Mechanical Systems James M. Hill, 2022-11-30 Despite successes of modern physics the existence of dark energy and matter is indicative that conventional mechanical accounting is lacking The most basic of all mechanical principles is Newton's second law and conventionally energy is just energy whether particle or wave energy In this monograph Louis de Broglie's idea of simultaneous existence of both particle and associated wave is developed with a novel proposal to account for mass and energy through a combined particle wave theory Newton's second law of motion is replaced by a fully Lorentz invariant reformulation inclusive of both particles and waves The model springs from continuum mechanics and forms a natural extension of special relativistic mechanics It involves the notion of force in the direction of time and every particle has both particle and wave energies arising as characteristics of space and time respectively Dark matter and energy then emerge as special or privileged states occurring for alignments of spatial forces with the force in the direction of time Dark matter is essentially a backward wave and dark energy a forward wave both propagating at the speed of light The model includes special relativistic mechanics and Schrödinger's quantum mechanics and the major achievements of mechanics and quantum physics Our ideas of particles and waves are not yet properly formulated and are bound up with the speed of light as an extreme limit and particle wave demarcation Subluminal particles have an associated superluminal wave so if subluminal waves have an associated superluminal particle then there emerges the prospect for faster than light travel with all the implications for future humanity Carefully structured over special relativity and quantum mechanics *Mathematics of Particle Wave Mechanical Systems* is not a completed story but perhaps the first mechanical model within which such exalted notions might be realistically and soberly examined If ultimately the distant universe become accessible this will necessitate thinking differently about particles waves and the role imposed by the speed of light The text constitutes a single proposal in that direction and a depository for mathematically related results It will appeal to researchers and students of mathematical physics applied mathematics and engineering mechanics

Optimized Dark Matter Searches in Deep Observations of Segue 1 with MAGIC Jelena Aleksić, 2015-11-06 This thesis presents the results of indirect dark matter searches in the gamma ray sky of the near Universe as seen by the MAGIC Telescopes The author has proposed and led the 160 hours long observations of the dwarf spheroidal galaxy Segue 1 which is the deepest survey of any such object by any Cherenkov telescope so far Furthermore she developed and completely characterized a new method dubbed Full Likelihood that optimizes the sensitivity of Cherenkov instruments for detection of gamma ray signals of dark matter origin Compared to the standard analysis techniques this novel approach introduces a sensitivity improvement of a factor of two i.e. it requires 4 times less observation time to achieve the same result In addition it allows a straightforward merger of results from different targets and/or detectors By selecting the optimal observational target and combining its very deep exposure with the Full Likelihood analysis of the acquired data the author has improved the existing MAGIC bounds to the dark matter properties by more than one order of magnitude Furthermore for particles more massive than a few hundred GeV those are the strongest

constraints from dwarf galaxies achieved by any gamma ray instrument both ground based or space borne alike **Sources and Detection of Dark Matter and Dark Energy in the Universe** David Cline, 2013-11-25 These proceedings provide the latest results on dark matter and dark energy research The UCLA Department of Physics and Astronomy hosted its tenth Dark Matter and Dark Energy conference in Marina del Rey and brought together all the leaders in the field The symposium provided a scientific forum for the latest discussions in the field Topics covered at the symposium Status of measurements of the equation of state of dark energy and new experiments The search for missing energy events at the LHC and implications for dark matter search Theoretical calculations on all forms of dark matter SUSY axions sterile neutrinos etc Status of the indirect search for dark matter Status of the direct search for dark matter in detectors around the world The low mass wimp search region The next generation of very large dark matter detectors New underground laboratories for dark matter search

From Quantum to Cosmos Slava G. Turyshev, 2009 Space based laboratory research in fundamental physics is an emerging research discipline that offers great discovery potential and at the same time could drive the development of technological advances which are likely to be important to scientists and technologists in many other different research fields The articles in this review volume have been contributed by participants of the international workshop From Quantum to Cosmos Fundamental Physics Research in Space held at the Airlie Center in Warrenton Virginia USA on May 21-24 2006 This unique volume discusses the advances in our understanding of fundamental physics that are anticipated in the near future and evaluates the discovery potential of a number of recently proposed space based gravitational experiments Specific research areas covered include various tests of general relativity and alternative theories search of physics beyond the Standard Model investigations of possible violations of the equivalence principle search for new hypothetical long and short range forces variations of fundamental constants tests of Lorentz invariance and attempts at unification of the fundamental interactions The book also encompasses experiments aimed at the discovery of novel phenomena including dark matter candidates and studies of dark energy Quantum Gravity and Quantum Cosmology Gianluca Calcagni, Lefteris Papantonopoulos, George Siopsis, Nikos Tsamis, 2012-10-31 Quantum gravity has developed into a fast growing subject in physics and it is expected that probing the high energy and high curvature regimes of gravitating systems will shed some light on how to eventually achieve an ultraviolet complete quantum theory of gravity Such a theory would provide the much needed information about fundamental problems of classical gravity such as the initial big bang singularity the cosmological constant problem Planck scale physics and the early time inflationary evolution of our Universe While in the first part of this book concepts of quantum gravity are introduced and approached from different angles the second part discusses these theories in connection with cosmological models and observations thereby exploring which types of signatures of modern and mathematically rigorous frameworks can be detected by experiments The third and final part briefly reviews the observational status of dark matter and dark energy and introduces alternative cosmological models Edited and authored by

leading researchers in the field and cast into the form of a multi author textbook at postgraduate level this volume will be of benefit to all postgraduate students and newcomers from neighboring disciplines wishing to find a comprehensive guide for their future research
