Facial Growth in the Rhesus Monkey Emet D. Schneiderman, 2014-07-14 For a wide spectrum of scientists from biomedical and dental researchers to primatologists and physical anthropologists Emet Schneiderman offers the most accurate and up to date presentation of the normal growth of the lower facial skeleton in a primate species His study is based on a sample of thirty five captive rhesus monkeys whose facial growth was traced over a ten year period spanning from infancy to adulthood The author identifies the relative contribution of various sites of growth quantifies the relative roles of different types of development such as appositional and condylar and sheds light on several long standing controversies as to how the primate face grows Unlike many of the traditional cephalometric measurements the ones included in this work were chosen to reflect the positional dimensional and localized remodeling changes that occur during ontogeny Using a new statistical approach designed for longitudinal data Schneiderman avoids the misleading information that has often resulted from older cross sectional statistical methods This book serves as a foundation for future experimental and normal studies in the rhesus monkey and from a methodological standpoint as a general model for future longitudinal growth studies Originally published in 1992 The Princeton Legacy Library uses the latest print on demand technology to again make available previously out of print books from the distinguished backlist of Princeton University Press These editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions The goal of the Princeton Legacy Library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by Princeton University Press since its founding in 1905 **Orofacial Functions: From Neural Mechanisms to**
