Blistering

Formation of bubbles like shapes on the painted surface is known as blistering.

Causes:

Many mechanisms can be involved, including osmotic gradients associated with soluble salts, soluble pigments, corrosion products, retained solvents, and solvents from cargoes. Nonosmotic blistering is associated with cathodic disbonding, thermal gradients related to cold-wall effects, and compressive stress.

Prevention:

Ensure correct surface preparation and application. Apply a suitable coating system after testing for soluble salts. Consider the possibility of the different blister mechanisms in the particular environment.

Chalking

A friable, powdery layer on the surface of a paint film. A change of color or fading is also seen. Chalking rates vary with pigment concentration and choice of binder. Chalking is
