Drying Technologies in Food Processing Xiao Dong Chen, Arun S. Mujumdar, 2009-03-16 Drying is by far the most useful large-scale operation method of keeping solid foods safe for long periods of time and is of fundamental importance in most sectors of food processing. Drying operations need to be precisely controlled and optimized in order to produce a good quality product that has the highest level of nutrient retention and flavor whilst maintaining microbial safety. This volume provides an up-to-date account of all the major drying technologies employed in the food industry and their underlying scientific principles and effects. Various equipment designs are classified and described. The impact of drying on food properties is covered, and the microstructural changes caused by the process are examined, highlighting their usefulness in process analysis and food design. Key methods for assessing food properties of dried products are described, and pre-concentration and drying control strategies are reviewed. Thermal hazards and fire explosion detection and prevention for dryers are discussed in a dedicated chapter. Where appropriate, sample calculations are included for engineers and technologists to follow. The book is directed at food scientists and technologists in industry and research, food engineers, and drying equipment manufacturers.

Advances in Dynamic Equations on Time Scales Martin Bohner, Allan C. Peterson, 2011-06-28 The development of time scales is still in its infancy, yet as inroads are made, interest is gathering steam. Of a great deal of interest

are methods being introduced for dynamic equations on time scales which now explain some discrepancies that have been encountered when results for differential equations and their discrete counterparts have been independently considered. The explanations of these seeming discrepancies are incidentally producing unifying results via time scales methods. The study of dynamic equations on time scales is a fairly new subject and research in this area is rapidly growing. It has been created in order to unify continuous and discrete analysis and it allows a simultaneous treatment of differential and difference equations extending those theories to so called dynamic equations. An introduction to this subject is given in *Dynamic Equations on Time Scales: An Introduction with Applications* by MARTIN BOHNER and ALLAN PETERSON, Birkhäuser 2001, 86 pages. The current book is designed to supplement this introduction and to offer access to the vast literature that has already emerged in this field. It consists of ten chapters written by an international team of 21 experts in their areas, thus providing an overview of the recent advances in the theory on time scales. We want to emphasize here that this book is not just a collection of papers by different authors.
