Bisaria, Akihiko Kondo, 2014-04-07 This book provides the vision of a successful biorefinery the lignocellulosic biomass needs to be efficiently converted to its constituent monomers comprising mainly of sugars such as glucose xylose mannose and arabinose Accordingly the first part of the book deals with aspects crucial for the pretreatment and hydrolysis of biomass to give sugars in high yield as well as the general aspects of bioprocessing technologies which will enable the development of biorefineries through inputs of metabolic engineering fermentation downstream processing and formulation The second part of the book gives the current status and future directions of the biological processes for production of ethanol a biofuel as well as an important commodity raw material solvents butanol isobutanol butanediols propanediols organic acids lactic acid 3 hydroxy propionic acid fumaric acid succinic acid and adipic acid and amino acid glutamic acid The commercial production of some of these commodity bioproducts in the near future will have a far reaching effect in realizing our goal of sustainable conversion of these renewable resources and realizing the concept of biorefinery Suitable for researchers practitioners graduate students and consultants in biochemical bioprocess engineering industrial microbiology bioprocess technology metabolic engineering environmental science and energy the book offers Exemplifies the

application of metabolic engineering approaches for development of microbial cell factories Provides a unique perspective to the industry about the scientific problems and their possible solutions in making a bioprocess work for commercial production of commodity bioproducts Discusses the processing of renewable resources such as plant biomass for mass production of commodity chemicals and liquid fuels to meet our ever increasing demands Encourages sustainable green technologies for the utilization of renewable resources Offers timely solutions to help address the energy problem as non renewable fossil oil will soon be unavailable Synthetic Biology engineering complexity and refactoring cell capabilities Pablo Carbonell, Jean Marie François, 2015-10-26 One of the key features of biological systems is complexity where the behavior of high level structures is more than the sum of the direct interactions between single components Synthetic Biologists aim to use rational design to build new systems that do not already exist in nature and that exhibit useful biological functions with different levels of complexity One such case is metabolic engineering where with the advent of genetic and protein engineering by supplying cells with chemically synthesized non natural amino acids and sugars as new building blocks it is now becoming feasible to introduce novel physical and chemical functions and properties into biological entities The rules of how complex behaviors arise however are not yet well understood For instance instead of considering cells as inert chassis in which synthetic devices could be easily operated to impart new functions the presence of these systems may impact cell physiology with reported effects on transcription translation metabolic fitness and optimal resource allocation The result of these changes in the chassis may be failure of the synthetic device unexpected or reduced device behavior or perhaps a more permissive environment in which the synthetic device is allowed to function While new efforts have already been made to increase standardization and characterization of biological components in order to have well known parts as building blocks for the construction of more complex devices also new strategies are emerging to better understand the biological dynamics underlying the phenomena we observe For example it has been shown that the features of single biological components i.e promoter strength ribosome binding affinity etc change depending on the context where the sequences are allocated Thus new technical approaches have been adopted to preserve single components activity as genomic insulation or the utilization of prediction algorithms able to take biological context into account There have been noteworthy advances for synthetic biology in clinical technologies biofuel production and pharmaceuticals production also metabolic engineering combined with microbial selection adaptation and fermentation processes allowed to make remarkable progress towards bio products formation such as bioethanol succinate malate and more interestingly heterologous products or even non natural metabolites However despite the many progresses it is still clear that ad hoc trial and error predominates over purely bottom up rational design approaches in the synthetic biology community In this scenario modelling approaches are often used as a descriptive tool rather than for the prediction of complex behaviors The initial confidence on a pure reductionist approach to the biological world has left space to a new and deeper investigation of the

complexity of biological processes to gain new insights and broaden the categories of synthetic biology In this Research Topic we host contributions that explore and address two areas of Synthetic Biology at the intersection between rational design and natural complexity 1 the impact of synthetic devices on the host cell or chassis and 2 the impact of context on the synthetic devices Particular attention will be given to the application of these principles to the rewiring of cell metabolism in a bottom up fashion to produce non natural metabolites or chemicals that should eventually serve as a substitute for petrol derived chemicals and on a long term view to provide economical ecological and ethical solutions to today s energetic and societal challenges
