**Fossil Scleractinian Corals from James Ross Basin, Antarctica** Harry F. Filkorn, 2013-03-21 Published by the American Geophysical Union as part of the Antarctic Research Series Volume 65 Sixteen scleractinian species are known from the Upper Cretaceous and Paleocene strata of Seymour and Snow Hill islands Antarctica based upon all type and newly collected material nine of those 16 species are described as new Seven of those nine new species are referred to the Turbinoliidae four genera of Turbinoliidae also are established as new *Frozen in Time* Jeffrey Stilwell, John Long, 2011-10-12 Presents a comprehensive overview of the fossil record of Antarctica framed within its changing environmental settings Jeffrey Stilwell Monash University John Long Australian palaeontologist currently at Natural History Museum of Los Angeles USA **Ocean Margin Systems** Gerold Wefer, David Billet, Dierk Hebbeln, Bo B. Jorgensen, Michael Schlüter, Tjeerd C.E. Van Weering, 2013-11-11 Ocean margins are the transitional zones between the oceans and continents They represent dynamic systems in which numerous processes shape the environment and result in impacting the utilization and hazard potentials for humans These processes are influenced by a variety of steering mechanisms from mountain building and climate on the land to tectonics and sea level fluctuations in ocean margins This book examines various aspects of regulation for the long term development of ocean margins of the impact of fluids and of the dynamics of benthic life at and below the seafloor in ocean margin systems Cold-water Corals J. Dunbar, 2003-01-10 Published by the American Geophysical Union as part of the Antarctic Research Series Volume 78 The seas surrounding Antarctica are the least studied on Earth yet they figure prominently in both the global climate system and the biogeochemical cycling of such key elements as C N Si and P The Southern Ocean affects climate directly through the sinking of surface waters via cooling and changes in salt content Such water near Antarctica moves slowly northward through all major ocean basins In doing so it retains a long lived signature of the physical and biological processes that occurred in Antarctic surface waters lasting many hundreds of years through all phases sinking northward flow and mixing or upwelling into the sunlit ocean

thousands of kilometers away By this process CO<sub>2</sub> that dissolves into the Antarctic seas may be stored in the deep ocean for centuries In fact the Southern Ocean is one of the most important regions on Earth for the uptake and subsurface transport of fossil fuel CO<sub>2</sub>

**Antarctic and Subantarctic Pycnogonida** C. Allan Child, 1995-01-09 Published by the American Geophysical Union as part of the Antarctic Research Series Volume 69 The Antarctic Research Series provides for the presentation of detailed scientific research results from Antarctica particularly the results of the United States Antarctic Research Program including monographs and long manuscripts The series is designed to make the results of Antarctic fieldwork available The Antarctic Research Series encourages the collection of papers on specific geographic areas within Antarctica In addition many volumes focus on particular disciplines including marine biology oceanology meteorology upper atmosphere physics terrestrial biology geology glaciology human adaptability engineering and environmental protection

Geology and Seismic Stratigraphy of the Antarctic Margin Alan K. Cooper, Peter F. Barker, Giuliano Brancolini, 1997-01-23 Published by the American Geophysical Union as part of the Antarctic Research Series Volume 71 The Antarctic Ice Sheet has greatly affected global climate sea level ocean circulation and southern hemisphere biota during Cenozoic times Much of our understanding of the evolution of the ice sheet has been inferred from isotopic studies on distant deep ocean sediments because few Cenozoic rocks are exposed on the Antarctic continent Yet large differences occur between past ice volumes inferred from isotopic studies and those inferred from low latitude sea level variation The massive quantities of glacially transported terrigenous sediments that lie beneath the Antarctic continental margin provide an additional more direct record of the inferred ice sheet fluctuations Volume 68 addresses the history of ice sheet fluctuations as recorded by geological and geophysical investigations of selected areas of the Antarctic continental margin As described below the volume gives data and results from on going research by a major multinational project directed toward better understanding the impact of Antarctic Ice Sheet fluctuations on global sea levels and climates

Contributions to Antarctic Research IV David H. Elliot, George L. Blaisdell, 1995-01-09 Published by the American Geophysical Union as part of the Antarctic Research Series Volume 67 A high amplitude magnetic anomaly occurs over the Butcher Ridge igneous complex in the Transantarctic Mountains This sill like body is approximately 10 km long where exposed It ranges from basalt to rhyolite in composition and has been suggested as evidence of a large mafic intrusion at depth A single NW SE aeromagnetic profile flown across Butcher Ridge gave an 8 km wide positive anomaly with maxima of about 700 and 1000 nT which are associated with topographic peaks that the aircraft cleared at about 300 and 600 m respectively The observed amplitude of the Butcher Ridge anomaly is too great to be caused by a typical sill of Ferrar Dolerite examples of which are widely exposed along the Transantarctic Mountains Models that fit the observed data indicate magnetizations comparable to the Jurassic Dufek layered mafic intrusion in the Transantarctic Mountains near the Weddell Sea Model calculations show that the upper and most magnetic part of the inferred intrusion must be greater than about 2 km thick and that the entire intrusion is probably

substantially thicker We interpret the source of the Butcher Ridge magnetic anomaly to be a layered mafic intrusion syntectonic with the Jurassic Transantarctic failed rift marked by the Ferrar Dolerite The magnetic evidence for a buried mafic body beneath the Butcher Ridge igneous complex is the first evidence of possible Jurassic cumulate rocks in the Transantarctic Mountains bordering the Ross Embayment Byrd Subglacial Basin Volcanological and Environmental Studies of Mount Erebus, Antarctica Philip R. Kyle, 1994-01-10 Published by the American Geophysical Union as part of the Antarctic Research Series Volume 66 In January 1841 Captain James Clark Ross sailed in his two small ships Erebus and Terror into the then unknown southern Ross Sea and discovered and named Mount Erebus In his journal Ross noted it proved to be a mountain twelve thousand four hundred feet of elevation above the level of the sea emitting flame and smoke in great profusion at first the smoke appeared like snow drift but as we drew nearer its true character became manifest On January 28 1841 Ross reported At 4 P M Mount Erebus was observed to emit smoke and flame in unusual quantities producing a most grand spectacle A volume of dense smoke was projected at each successive jet with great force in a vertical column to the height of between fifteen hundred and two thousand feet above the mouth of the crater when condensing first at its upper part it descended in mist or snow and gradually dispersed to be succeeded by another splendid exhibition of the same kind in about half an hour afterwards although the intervals between eruptions were by no means regular The diameter of the columns of smoke was between two and three hundred feet as near as we could measure it whenever the smoke cleared away the bright red flame that filled the mouth of the crater was clearly perceptible and some of the officers believed they could see streams of lava pouring down its sides until lost beneath the snow *Palaeo Down Under Conference* J. R. Laurie, 2002 Extracting Paleoenvironmental Records from Molluscan Carbonate Andrea L. Dutton, 2003 Ecosystem Dynamics in a Polar Desert, 1998 Ecosystem Dynamics in a Polar Desert John Charles Prisco, 1998 *Foundations for Ecological Research West of the Antarctic Peninsula* Robin M. Ross, Eileen E. Hofmann, Langdon B. Quetin, 1996-01-09 Published by the American Geophysical Union as part of the Antarctic Research Series Volume 70 The Long Term Ecological Research LTER Program was established in 1981 by the United States National Science Foundation in recognition of the need to study ecological processes over time spans longer than those of most research grants The LTER Network now consists of 18 sites that span a variety of ecosystem types in the continental United States Alaska Puerto Rico and Antarctica The addition of the Palmer LTER at Palmer Station Antarctica in October 1990 extended the geographical and ecological range of the LTER Network and provided the opportunity to link physical and ecological processes in the northern and southern hemispheres One criterion for establishment of a LTER site is the existence of historical data and observations that can provide a basis for guiding research programs Thus the intent of this volume is to bring together meteorological hydrographical biological and ecological observations made in the general area west of the Antarctic Peninsula and to discuss the processes underlying the observations This compilation of available data and observations in conjunction with the

present understanding of processes provides the foundation for long term studies of the ecosystem in the western Antarctic Peninsula region      **Ocean, Ice, and Atmosphere** Stanley S. Jacobs, Ray F. Weiss, 1998-02-04 In this latest oceanology volume of the Antarctic Research Series polar scientists describe and model air sea and ice ocean interactions the formation and chemistry of deep and bottom waters regional circulations tidal heights and currents ocean bathymetry interannual variability and the Antarctic Slope Front
