*K3 Projective Models in Scrolls* Andreas L. Knutsen, Trygve Johnsen, 2014-01-15      [K3 Projective Models in Scrolls](#)  
Trygve Johnsen, Andreas L. Knutsen, 2004      [K3 Projective Models in Scrolls](#) Andreas L. Knutsen, Trygve Johnsen, 2004-04-30  
The exposition studies projective models of K3 surfaces whose hyperplane sections are non Clifford general curves These models are contained in rational normal scrolls The exposition supplements standard descriptions of models of general K3 surfaces in projective spaces of low dimension and leads to a classification of K3 surfaces in projective spaces of dimension at most 10 The authors bring further the ideas in Saint Donat's classical article from 1974 lifting results from canonical curves to K3 surfaces and incorporating much of the Brill Noether theory of curves and theory of syzygies developed in the mean time      *K3 Projective Models in Rational Normal Scrolls* Trygve Johnsen, Andreas Leopold Knutsen, 2001      **Blow-up Theories for Semilinear Parabolic Equations** Bei Hu, 2011-03-23 There is an enormous amount of work in the literature about the blow up behavior of evolution equations It is our intention to introduce the theory by emphasizing the methods while seeking to avoid massive technical computations To reach this goal we use the simplest equation to illustrate the methods these methods very often apply to more general equations      *Abstract Harmonic Analysis of Continuous Wavelet Transforms*, 2005      **Topological Complexity of Smooth Random Functions** Robert Adler, Jonathan E. Taylor, 2011-05-18  
These notes based on lectures delivered in Saint Flour provide an easy introduction to the authors 2007 Springer monograph *Random Fields and Geometry* While not as exhaustive as the full monograph they are also less exhausting while still covering the basic material typically at a more intuitive and less technical level They also cover some more recent material relating to random algebraic topology and statistical applications The notes include an introduction to the general theory of Gaussian random fields treating classical topics such as continuity and boundedness This is followed by a quick review of geometry both integral and Riemannian with an emphasis on tube formulae to provide the reader with the material needed to understand and use the Gaussian kinematic formula the main result of the notes This is followed by chapters on topological inference and random algebraic topology both of which provide applications of the main results      [Eigenvalues, Embeddings and Generalised Trigonometric Functions](#) Jan Lang, David Edmunds, 2011-03-23 The main theme of the book is the study from the standpoint of  $s$  numbers of integral operators of Hardy type and related Sobolev embeddings In the theory of  $s$  numbers the idea is to attach to every bounded linear map between Banach spaces a monotone decreasing sequence of non negative numbers with a view to the classification of operators according to the way in which these numbers approach a limit approximation numbers provide an especially important example of such numbers The asymptotic behavior of the  $s$  numbers of Hardy operators acting between Lebesgue spaces is determined here in a wide variety of cases The proof methods involve the geometry of Banach spaces and generalized trigonometric functions there are connections with the theory of the  $p$  Laplacian      **The Valuative Tree** Charles Favre, Mattias Jonsson, 2004-08-30 This volume is devoted to a beautiful object

called the valuative tree and designed as a powerful tool for the study of singularities in two complex dimensions Its intricate yet manageable structure can be analyzed by both algebraic and geometric means Many types of singularities including those of curves ideals and plurisubharmonic functions can be encoded in terms of positive measures on the valuative tree The construction of these measures uses a natural tree Laplace operator of independent interest Topology of Singular Fibers of Differentiable Maps Osamu Saeki,2004

**Lebesgue and Sobolev Spaces with Variable Exponents** Lars Diening,Petteri Harjulehto,Peter Hästö,Michael Ruzicka,2011-03-29 The field of variable exponent function spaces has witnessed an explosive growth in recent years The standard reference article for basic properties is already 20 years old Thus this self contained monograph collecting all the basic properties of variable exponent Lebesgue and Sobolev spaces is timely and provides a much needed accessible reference work utilizing consistent notation and terminology Many results are also provided with new and improved proofs The book also presents a number of applications to PDE and fluid dynamics

*Posn(R) and Eisenstein Series* ,2005 **Statistical Learning Theory and Stochastic Optimization** Olivier Catoni,2004-08-30 Statistical learning theory is aimed at analyzing complex data with necessarily approximate models This book is intended for an audience with a graduate background in probability theory and statistics It will be useful to any reader wondering why it may be a good idea to use as is often done in practice a notoriously wrong i e over simplified model to predict estimate or classify This point of view takes its roots in three fields information theory statistical mechanics and PAC Bayesian theorems Results on the large deviations of trajectories of Markov chains with rare transitions are also included They are meant to provide a better understanding of stochastic optimization algorithms of common use in computing estimators The author focuses on non asymptotic bounds of the statistical risk allowing one to choose adaptively between rich and structured families of models and corresponding estimators Two mathematical objects pervade the book entropy and Gibbs measures The goal is to show how to turn them into versatile and efficient technical tools that will stimulate further studies and results *Tutorials in Mathematical Biosciences II* James Sneyd,2005-06-13 This book presents a series of models in the general area of cell physiology and signal transduction with particular attention being paid to intracellular calcium dynamics and the role played by calcium in a variety of cell types Calcium plays a crucial role in cell physiology and the study of its dynamics lends insight into many different cellular processes In particular calcium plays a central role in muscular contraction olfactory transduction and synaptic communication three of the topics to be addressed in detail in this book In addition to the models much of the underlying physiology is presented so that readers may learn both the mathematics and the physiology and see how the models are applied to specific biological questions It is intended primarily as a graduate text or a research reference It will serve as a concise and up to date introduction to all those who wish to learn about the state of calcium dynamics modeling and how such models are applied to physiological questions

Fourier Transforms of Invariant Functions on Finite Reductive Lie Algebras Emmanuel Letellier,2004-11-15 The Fourier

transforms of invariant functions on finite reductive Lie algebras are due to T A Springer 1976 in connection with the geometry of nilpotent orbits In this book the author studies Fourier transforms using Deligne Lusztig induction and the Lie algebra version of Lusztig s character sheaves theory He conjectures a commutation formula between Deligne Lusztig induction and Fourier transforms that he proves in many cases As an application the computation of the values of the trigonometric sums on reductive Lie algebras is shown to reduce to the computation of the generalized Green functions and to the computation of some fourth roots of unity

**Hypoelliptic Estimates and Spectral Theory for Fokker-Planck Operators and Witten Laplacians** Francis Nier, Bernard Helffer, 2005-02-11 There has recently been a renewal of interest in Fokker Planck operators motivated by problems in statistical physics in kinetic equations and differential geometry Compared to more standard problems in the spectral theory of partial differential operators those operators are not self adjoint and only hypoelliptic The aim of the analysis is to give as generally as possible an accurate qualitative and quantitative description of the exponential return to the thermodynamical equilibrium While exploring and improving recent results in this direction this volume proposes a review of known techniques on the hypoellipticity of polynomial of vector fields and its global counterpart the global Weyl H rmander pseudo differential calculus the spectral theory of non self adjoint operators the semi classical analysis of Schr dinger type operators the Witten complexes and the Morse inequalities

*Some Mathematical Models from Population Genetics* Alison Etheridge, 2011-01-05 This work reflects sixteen hours of lectures delivered by the author at the 2009 St Flour summer school in probability It provides a rapid introduction to a range of mathematical models that have their origins in theoretical population genetics The models fall into two classes forwards in time models for the evolution of frequencies of different genetic types in a population and backwards in time coalescent models that trace out the genealogical relationships between individuals in a sample from the population Some like the classical Wright Fisher model date right back to the origins of the subject Others like the multiple merger coalescents or the spatial Lambda Fleming Viot process are much more recent All share a rich mathematical structure Biological terms are explained the models are carefully motivated and tools for their study are presented systematically

*The Wulff Crystal in Ising and Percolation Models* Raphaël Cerf, 2006-05-12 This volume is a synopsis of recent works aiming at a mathematically rigorous justification of the phase coexistence phenomenon starting from a microscopic model It is intended to be self contained Those proofs that can be found only in research papers have been included whereas results for which the proofs can be found in classical textbooks are only quoted

**Concentration Inequalities and Model Selection** Pascal Massart, 2007-04-26 Concentration inequalities have been recognized as fundamental tools in several domains such as geometry of Banach spaces or random combinatorics They also turn to be essential tools to develop a non asymptotic theory in statistics This volume provides an overview of a non asymptotic theory for model selection It also discusses some selected applications to variable selection change points detection and statistical learning

**Random Perturbation of PDEs and**

**Fluid Dynamic Models** Franco Flandoli, 2011-03-02 The book deals with the random perturbation of PDEs which lack well posedness mainly because of their non uniqueness in some cases because of blow up The aim is to show that noise may restore uniqueness or prevent blow up This is not a general or easy to apply rule and the theory presented in the book is in fact a series of examples with a few unifying ideas The role of additive and bilinear multiplicative noise is described and a variety of examples are included from abstract parabolic evolution equations with non Lipschitz nonlinearities to particular fluid dynamic models like the dyadic model linear transport equations and motion of point vortices
