Reber, David A. Slattery, 2017-01-13 Chronic or repeated stress particularly psychosocial stress is an acknowledged risk factor for numerous affective and somatic disorders in modern societies Thus there is substantial evidence showing that chronic stress can increase the likelihood of major depressive disorder and anxiety disorders as well as cardiovascular diseases irritable bowel syndrome and pain syndromes to name but a few in vulnerable individuals Although a number of pharmacological agents are available to treat such stress related disorders many patients do not respond to them and those who do often report a number of side effects Therefore a major emphasis in modern basic research is to uncover the underlying aetiology of these disorders and to develop novel efficacious treatment strategies This has led to a resurgence in developing and using appropriate animal models to study a wide variety of stress related disorders Thus the aim of this research topic Using stress based animal models to understand the mechanisms underlying psychiatric and somatic disorders was to bring together novel research articles and comprehensive review articles from prominent stress researchers In addition to describing the insights such models have provided relating to the aetiology of psychiatric and somatic disorders these articles also encompass mechanisms that are believed to underlie stress resilience and stress protection Finally given the current prominence on the role of the brain gut axis in health and disease the research topic covers the emerging evidence showing how the gut particularly the microbiota influences affective behaviour and physiology Judgment and Decision Making Under Uncertainty: Descriptive, Normative, and Prescriptive Perspectives David R. **Oxford Guide to Behavioural Experiments in Cognitive Therapy** Khadj Rouf, 2004-05-06 Behavioural experiments are one of the central and most powerful methods of intervention in cognitive therapy Yet until now there has been no volume specifically dedicated to guiding physicians who wish to design and implement behavioural experiments across a wide range of clinical problems The Oxford Guide to Behavioural Experiments in Cognitive Therapy fills this gap It is written by clinicians for clinicians It is a practical easy to read handbook which is relevant for practising clinicians at every level from trainees to cognitive therapy supervisors Following a foreword by David Clark the first two chapters provide a theoretical and practical background for the understanding and development of behavioural experiments Thereafter the remaining chapters of the book focus on particular problem areas These include problems which have been the traditional focus of cognitive therapy e g depression anxiety disorders as well as those which have only more recently become a subject of study bipolar disorder psychotic symptoms and some which are still in their relative infancy physical health problems brain injury The book also includes several chapters on transdiagnostic problems such as avoidance of affect low self esteem interpersonal issues and self injurious behaviour A final chapter by Christine Padesky provides some signposts for future development Containing examples of over 200 behavioural experiments this book will be of enormous practical value for all those involved in cognitive behavioural therapy as well as stimulating exploration and creativity in both its readers and their patients

*Affect Imagery Consciousness* Silvan S. Tomkins, PhD, 2008-02-15 brilliant Malcolm Gladwell Author of Blink The writings for which this essay is offered as a Prologue consumed him from the mid 1950s through the end of his life in 1991 Knowing it was his lifework Tomkins conflated life and work reifying the superstition that its completion would equal death and refusing to release for publication long completed material He knew the risks associated with this obsessive neurotic behavior and the results were as bad as predicted The first two volumes of *Affect Imagery Consciousness* AIC were released in 1962 and 1963 Volume III in 1991 shortly before he succumbed to a particularly virulent strain of small cell lymphoma and Volume IV a year after his death This last book contains Tomkins's understanding of neocortical cognition ideas that are even now exciting but until this current publication of his work as a single supervolume almost nobody has read it The bulk of his audience had died along with the enthusiasm generated by his ideas Big science is now more a matter of big machines and unifocal discoveries as the basis for pars pro toto reasoning than big ideas based on the assembly and analysis of all that is known Tomkins ignored nothing from any science past or present that might lead him toward a more certain understanding of the mind Every idea every theory deserved attention if only because significant observations can loiter in blind alleys From the Prologue by Donald L Nathanson MD Volume 1 of Springer's magisterial new two volume edition of Tomkins's magnum opus comprises *The Positive Affects* and *The Negative Affects*

**Social Learning** Thomas R. Zentall, B. G. Galef, Jr., 2013-12-16 First published in 1988 During the past decade there has been a marked increase in the number of North American and European laboratories engaged in the study of social learning As a consequence evidence is rapidly accumulating that in animals as in humans social interaction plays an important role in facilitating development of adaptive patterns of behavior Experimenters are isolated both by the phenomena they study and by the species with which they work The process of creating a coherent field out of the diversity of current social learning research is likely to be both long and difficult It the authors hope that the present volume may prove a useful first step in bringing order to a diverse field

**Thought Experiments** Roy A. Sorensen Associate Professor of Philosophy New York University, 1992-08-06 Sorensen presents a general theory of thought experiments what they are how they work what are their virtues and vices On Sorensen's view philosophy differs from science in degree but not in kind For this reason he claims it is possible to understand philosophical thought experiments by concentrating on their resemblance to scientific relatives Lessons learned about scientific experimentation carry over to thought experiment and vice versa Sorensen also assesses the hazards and pseudo hazards of thought experiments Although he grants that there are interesting ways in which the method leads us astray he attacks most scepticism about thought experiments as arbitrary They should be used he says as they generally are used as part of a diversified portfolio of techniques All of these devices are individually susceptible to abuse fallacy and error Collectively however they provide a network of cross checks that make for impressive reliability

**From Acute to Chronic Back Pain** Monika I. Hasenbring, Adina C. Rusu, Dennis C. Turk, 2012-01-19 Chronic back pain has been and continues to be a major cause of distress both to people with persistent pain and their significant others disability work loss and a huge cost to society Moreover with the aging population it is becoming even more prevalent and as a consequence is having an escalating impact upon the healthcare systems and society as a whole worldwide A significant issue concerns understanding why although the majority of people with acute back symptoms recover in a reasonable time a significant minority evolve into patients with chronic pain and prolonged pain related disability

Understanding the variables that contribute to chronicity could serve as a basis for early intervention to prevent the downward spiral. In the past 15 years psychological and psychobiological mechanisms have been identified as important risk factors in back pain leading to the development of early screening methods. Yellow Flag diagnostics and new psychosocial interventions. These work by closely targeting treatment modalities to patients' needs. However many aspects of how acute pain becomes chronic pain remain unexplained. Recent neurobiological work investigating genetic neurophysiological and biomechanical processes has uncovered important mechanisms involved in chronic and acute back pain. From Acute to Chronic Back Pain examines the risk factors and mechanisms involved in the transition from acute to chronic back pain. It integrates genetic biomechanical neurobiological psychophysiological psychosocial and socioeconomic risk factors. Moreover the text examines advances in treatment approaches based on evidence from published studies ranging from prevention of disability to pharmacological psychological and rehabilitative strategies and methods. Broad in scope and with contributions from leading authorities in their respective fields this book is a valuable and comprehensive work for the many specialities involved with back pain including those in the fields of clinical and health psychology physiology epidemiology and pain.

**Current Topics in Animal Learning** Lawrence Dachowski, Charles F. Flaherty, 2013-02-01 This book based on the Flowerree Mardi Gras Symposium at Tulane University juxtaposes contemporary research and theory from several areas of animal learning: learning theory, comparative cognition, animal models of human behavior and functional neurology. Investigators pursuing these different routes often work in isolation of progress being made in what should be related fields. This book will acquaint students and researchers with a variety of topics ordinarily treated separately in a way that will stimulate integrative thinking. Cognitive interpretations of animal learning are included as well as recent developments in conditioning theory, physiological bases of learning, animal models of human behavior, problems and psychopharmacology.

**Binocular rivalry: a gateway to consciousness** Alexander Maier, Theofanis Panagiotaropoulos, Naotsugu Tsuchiya, Georgios A. Keliris, Brain/mind problems like

consciousness have been stimulating the interest of philosophers and scientists since the ancient times In the last decades the dramatic development of neuroscience has allowed studying such phenomena at several different levels from single neurons to behavior Binocular rivalry a paradigm dissociating the sensory input from the conscious perception during dichoptic viewing of incongruent images has been a celebrated example of such a tool During the last century empirical research on binocular rivalry contributed the first important insights into the neuronal mechanisms of subjective visual perception Recent advances in brain imaging and electrophysiological recording stimulating techniques as well as novel theoretical concepts and analytical methods could be exploited to expand our knowledge on this fascinating phenomenon of visual perception and elucidate the neural processes underlying visual consciousness This Research Topic aims to bring together contributions that could expand the current frontiers of knowledge in binocular rivalry In particular we would like to focus on reviews hypothesis theory or original research articles that specifically combine novel concepts analytical tools and neurophysiological techniques with binocular rivalry We expect that these contributions will a integrate the vast knowledge already existing in the field b formulate and when possible address questions under the light of recent methodological advances in neuroscience and c provide a benchmark that will stimulate future cutting edge research
