evolution of the flora of this fascinating continent *Estuaries of Australia in 2050 and beyond* Eric Wolanski, 2013-08-28 The book addresses the questions Is Australia's rapidly growing human population and economy environmentally sustainable for its estuaries and coasts What is needed to enable sustainable development To answer these questions this book reports detailed studies of 20 iconic Australian estuaries and bays by leading Australian estuarine scientists That knowledge is synthesised in time and space across Australia to suggest what Australian estuaries will look like in 2050 and beyond based on socio economic decisions that are made now and changes that are needed to ensure sustainability The book also has a Prologue by Mr Malcolm Fraser former Prime Minister of Australia which bridges environmental science population policy and sustainability **Australian Soils and Landscapes** Neil N. Australian Landscapes P. Bishop, B. Pillans, Brad Pillans, 2010 Australian Landscapes provides an up to date statement on the geomorphology of Australia Karst desert bedrock rivers coasts submarine geomorphology biogeomorphology and tectonics are all covered aided by the latest geochronological techniques and remote sensing approaches The antiquity and enduring geomorphological stability of the Australian continent are emphasized in several chapters but the cutting edge techniques used to establish that stability also reveal much complexity including areas of considerable recent tectonic activity and a wide range of rates of landscape change Links to the biological sphere are explored in relation both to the lengthy human presence on the continent and to a biota that resulted from Cenozoic aridification of the continent dated using new techniques New syntheses of glaciation in Tasmania aridification in South Australia and aeolian activity all focus on Quaternary landscape evolution

The Origin of Mountains Cliff Ollier, Colin Pain, 2004-08-02 The Origins of Mountains approaches mountains from facts about mountain landscapes rather than theory The book illustrates that almost everywhere mountains arose by vertical uplift of a former plain and by a mixture of cracking and warping by earth movements and erosion by rivers and glaciers the present mountainous landscapes were created It also gives evidence that this uplift only occurred in the last few million years a time scale which does not fit the plate tectonics theory Another fascinating part of the evidence shows that mountain uplift correlates very well with climatic change Mountain building could have been responsible for the onset of the ice age It certainly resulted in the creation of new environments Fossil plants and animals are used in places to work out the time of mountain uplift which in turn helps to explain biogeographical distributions
