*Elements of Gasdynamics* Hans Wolfgang Liepmann,Anatol Roshko,2001-01-01 The increasing importance of concepts from compressible fluid flow theory for aeronautical applications makes the republication of this first rate text particularly timely Intended mainly for aeronautics students the text will also be helpful to practicing engineers and scientists who work on problems involving the aerodynamics of compressible fluids Covering the general principles of gas dynamics to provide a working understanding of the essentials of gas flow the contents of this book form the foundation for a study of the specialized literature and should give the necessary background for reading original papers on the subject Topics include introductory concepts from thermodynamics including entropy

reciprocity relations equilibrium conditions the law of mass action and condensation one dimensional gasdynamics one dimensional wave motion waves in supersonic flow flow in ducts and wind tunnels methods of measurement the equations of frictionless flow small perturbation theory transonic flow effects of viscosity and conductivity and much more The text includes numerous detailed figures and several useful tables while concluding exercises demonstrate the application of the material in the text and outline additional subjects Advanced undergraduate or graduate physics and engineering students with at least a working knowledge of calculus and basic physics will profit immensely from studying this outstanding volume

**For Greener Skies** National Research Council, Division on Engineering and Physical Sciences, Aeronautics and Space Engineering Board, Committee on Aeronautics Research and Technology for Environmental Compatibility, 2002-04-24 Each new generation of commercial aircraft produces less noise and fewer emissions per passenger kilometer or ton kilometer of cargo than the previous generation However the demand for air transportation services grows so quickly that total aircraft noise and emissions continue to increase Meanwhile federal state and local noise and air quality standards in the United States and overseas have become more stringent It is becoming more difficult to reconcile public demand for inexpensive easily accessible air transportation services with concurrent desires to reduce noise improve local air quality and protect the global environment against climate change and depletion of stratospheric ozone This situation calls for federal leadership and strong action from industry and government U S government industry and universities conduct research and develop technology that could help reduce aircraft noise and emissions but only if the results are used to improve operational systems or standards For example the now terminated Advanced Subsonic Technology Program of the National Aeronautics and Space Administration NASA generally brought new technology only to the point where a system subsystem model or prototype was demonstrated or could be validated in a relevant environment Completing the maturation process by fielding affordable proven commercially available systems for installation on new or modified aircraft was left to industry and generally took place only if industry had an economic or regulatory incentive to make the necessary investment In response to this situation the Federal Aviation Administration NASA and the Environmental Protection Agency asked the Aeronautics and Space Engineering Board of the National Research Council to recommend research strategies and approaches that would further efforts to mitigate the environmental effects i e noise and emissions of aviation The statement of task required the Committee on Aeronautics Research and Technology for Environmental Compatibility to assess whether existing research policies and programs are likely to foster the technological improvements needed to ensure that environmental constraints do not become a significant barrier to growth of the aviation sector
