Hybrid Vegetables for Nutritional Security Indra Dutta Tyagi, 1998 *Sustainable Horticulture Development and Nutrition Security (Vol. 3)* Prem Nath, 2018-01-01 We all are indebted to nature for providing us food and its resources for our subsistence and survival In the food domain cereal and legume grains occupy the front line whereas horticultural crops have occupied the second line of defense For healthy diet cereals and legumes provide us with carbohydrates and protein whereas fruits and vegetables provide us minerals and vitamins Both macro and micro nutrients are essential for human growth and development The fruits and vegetables are the major source of micro nutrients It is estimated that up to 27 million lives could potentially be saved each year if fruit and vegetable production was sufficiently increased Both at national and international levels food and agriculture horticulture development plans and estimates are basically developed framed and implemented and narrowed down to cereal production In the present context of attaining nutrition security this mode of thinking on food needs to be changed to nutrients which will include necessarily all those crops including fruit and vegetables which provide all macro and micro nutrients to ensure balanced nutrition needed for good human health The present publication has attempted to reflect and discuss the above views and ideas on the subject of sustainable horticulture development and nutrition security in nine chapters with 32 articles by 32 authors Heterosis Breeding in Vegetable Crops Nagendra Rai, Mathura Rai, 2006 With reference to India Smart Farming Technologies to Attain Food and Nutrition Security P. agriculture is a rapidly growing field aiming at producing food and energy in a sustainable way for humans and their children. Sustainable agriculture is a discipline that addresses current issues such as climate change, increasing food and fuel prices, poor nutrition, starvation in rich nations, obesity, water pollution, soil erosion, fertility loss, pest control, and biodiversity depletion. Novel environmentally friendly solutions are proposed based on integrated knowledge from sciences as diverse as agronomy, soil science, molecular biology, chemistry, toxicology, ecology, economy, and social sciences. Indeed, sustainable agriculture deciphers mechanisms of processes that occur from the molecular level to the farming system to the global level at time scales ranging from seconds to centuries. For that, scientists use the systems approach that involves studying components and interactions of a whole system to address scientific, economic, and social issues. In that respect, sustainable agriculture is not a classical narrow science. Instead of solving problems using the classical painkiller approach that treats only negative impacts, sustainable agriculture treats problem sources. Because most actual society issues are now intertwined, global and fast-developing sustainable agriculture will bring solutions to build a safer world.

Stress Tolerance in Horticultural Crops

Ajay Kumar, Avinash Chandra Rai, Ashutosh Rai, Krishna Kumar Rai, Ved Prakash Rai, 2021-05-14. *Stress Tolerance in Horticultural Crops: Challenges and Mitigation Strategies* explores concepts, strategies, and recent advancements in the area of abiotic stress tolerance in horticultural crops, highlighting the latest advances in molecular breeding, genome sequencing, and functional genomics approaches. Further sections present specific insights on different aspects of abiotic stress tolerance, from classical breeding, hybrid breeding, speed breeding, epigenetics, gene quantitative trait loci (QTL) mapping, transgenics, physiological and biochemical approaches to OMICS approaches including functional genomics, proteomics, and genomics-assisted breeding. Due to constantly changing environmental conditions, abiotic stress such as high temperature, salinity, and drought are being understood as an imminent threat to horticultural crops, including their detrimental effects on plant growth, development, reproduction, and ultimately on yield. This book offers a comprehensive resource on new developments that is ideal for anyone working in the field of abiotic stress management in horticultural crops, including researchers, students, and educators. Describes advances in whole genome and next generation sequencing approaches for breeding climate-smart horticultural crops. Details advanced germplasm tolerance to abiotic stresses screened in the recent past and their performance. Includes advancements in OMICS approaches in horticultural crops.

Genomic Designing for Biotic

Stress-Resistant Vegetable Crops Chittaranjan Koley, 2022-07-02. Biotic stresses cause yield loss of 31–42% in crops, in addition to 6–20% during post-harvest stage. Understanding interaction of crop plants to the biotic stresses caused by insects, bacteria, fungi, viruses, and oomycetes etc. is important to develop resistant crop varieties. Knowledge on the advanced genetic and genomic crop improvement strategies, including molecular breeding, transgenics, genomics-assisted breeding, and the recently emerging genome editing for developing resistant varieties in vegetable crops is imperative for addressing FPNEE (food, health, nutrition, energy, and environment security). Whole genome sequencing of these crops followed by genotyping by

sequencing have facilitated precise information about the genes conferring resistance useful for gene discovery allele mining and shuttle breeding which in turn opened up the scope for designing crop genomes with resistance to biotic stresses The nine chapters each dedicated to a vegetable crop or crop group in this volume will deliberate on different types of biotic stress agents and their effects on and interaction with crop plants will enumerate on the available genetic diversity with regard to biotic stress resistance among available cultivars illuminate on the potential gene pools for utilization in interspecific gene transfer will brief on the classical genetics of stress resistance and traditional breeding for transferring them to their cultivated counterparts will enunciate the success stories of genetic engineering for developing biotic stress resistant varieties will discuss on molecular mapping of genes and QTLs underlying biotic stress resistance and their marker assisted introgression into elite varieties will enunciate on different emerging genomics aided techniques including genomic selection allele mining gene discovery and gene pyramiding for developing resistant crop varieties with higher quantity and better quality and will also elaborate some case studies on genome editing focusing on specific genes for generating disease and insect resistant crops
