## **Hydrologic Forecasting Methods:**

*Hydrological Forecasting* J. Nemec, 2012-12-06 In the past two decades several activities in the field of water resources management have been enhanced and intensified This rise had at least two independent reasons The first and main one was the constantly increasing water demand for agriculture and industry on one side and the concern about the deteriorating environment on the other While this last concern was lately overshadowed by deterioration of national economies the quantity of available water resources has certainly not increased with the growing scarcity of funds for its development and protection Furthermore the standard of living which raised across the world even in India and China countries which concentrate more than a third of the world population has made people and their governments more aware of natural disasters caused by weather Since a large percentage of losses in human life and material damage from weather related disasters are caused by water either by its excess or scarcity the concern about water has been increasingly associated with these disasters The second reason for intensified water resources management is man s spectacular technological advance in electronics computers and use of satellites The Koran says that two things cannot be predicted the sex of the child in its mother s womb and the quantity of water that falls from the sky and flows in rivers Technological progress has disproved both of these caveats

**Advances in Hydrologic Forecasts and Water Resources Management** Fi-John Chang, Shenglian Guo, 2021-01-20 The impacts of climate change on water resource management as well as increasingly severe natural disasters over the last decades have caught global attention Reliable and accurate hydrological forecasts are essential for efficient water resource management and the mitigation of natural disasters While the notorious nonlinear hydrological processes make accurate forecasts a very challenging task it requires advanced techniques to build accurate forecast models and reliable management systems One of the newest techniques for modeling complex systems is artificial intelligence AI AI can replicate the way humans learn and has great capability to efficiently extract crucial information from large amounts of data to solve complex problems The fourteen research papers published in this Special Issue contribute significantly to the uncertainty assessment of operational hydrologic forecasting under changing environmental conditions and the promotion of water resources management by using the latest advanced techniques such as AI techniques The fourteen contributions across four major research areas 1 machine learning approaches to hydrologic forecasting 2 uncertainty analysis and assessment on hydrological modeling under changing environments 3 AI techniques for optimizing multi objective reservoir operation 4 adaption strategies of extreme hydrological events for hazard mitigation The papers published in this issue will not only advance water sciences but also help policymakers to achieve more sustainable and effective water resource

management     Assessment of Hydrologic and Hydrometeorological Operations and Services National Research Council, Division on Engineering and Physical Sciences, Commission on Engineering and Technical Systems, National Weather Service Modernization Committee, 1997-01-03 Floods are by far the most devastating of all weather related hazards in the United States The National Weather Service NWS is charged by Congress to provide river and flood forecasts and warnings to the public to protect life and property and to promote the nation's economic and environmental well being such as through support for water resources management As part of a modernization of its technologies and organizational structure the NWS is undertaking a thorough updating of its hydrologic products and services and the activities that produce them The National Weather Service Modernization Committee of the National Research Council undertook a comprehensive assessment of the NWS plans and progress for the modernization of hydrologic and hydrometeorological operations and services The committee's conclusions and recommendations and their related analysis and rationale are presented in this report     *Hydrometeorology* Kevin Sene, 2015-12-09 This second edition explores some of the latest techniques used to provide forecasts for a wide range of water related applications in areas such as floods droughts water resources and environmental impacts The practical uses can range from decisions on whether to issue a flood warning through to providing longer term advice such as on when to plant and harvest crops or how to operate reservoirs for water supply and hydropower schemes It provides an introduction to the topic for practitioners and researchers and useful background for courses in areas such as civil engineering water resources meteorology and hydrology As in the first edition the first section considers topics such as monitoring and forecasting techniques demand forecasting and how forecasts are interpreted when issuing warnings or advice Separate chapters are now included for meteorological and catchment monitoring techniques allowing a more in depth discussion of topics such as weather radar and water quality observations The chapters on meteorological and hydrological forecasting now include a greater emphasis on rainfall forecasting and ensemble and probabilistic techniques Regarding the interpretation of forecasts an updated chapter discusses topics such as approaches to issuing warnings and the use of decision support systems and risk based techniques Given the rapid pace of development in flash flood forecasting techniques flash floods and slower responding riverine floods are now considered in separate chapters This includes more detail on forecasting floods in large river basins and on methods for providing early warnings of debris flows surface water flooding and ice jam and dam break floods Later chapters now include more information on developing areas such as environmental modelling and seasonal flow forecasting As before examples of operational systems are provided throughout and the extensive sets of references which were a feature of the first edition have been revised and updated Key themes floods droughts meteorological observations catchment monitoring meteorological forecasts hydrological forecasts demand forecasts reservoirs water resources water quality decision support data assimilation probabilistic forecasts Kevin Sene is a civil engineer and researcher with wide experience in flood risk management water resources and hydrometeorology He has

previously published books on flood warning forecasting and emergency response and flash floods Springer 2008 2013

**Hydrological Forecasting with Radar and the Probability Distributed Hydrological Model (PDM)** Gbotemi Abraham Adediran, 2015-07-01 The efficiency of a probabilistic hydrological forecasting system with weather radar and the Probability distributed hydrological model PDM was evaluated at the Brue catchment south western England The ability of the radar to measure gauged precipitation in 2007 regarded as the ground truth was evaluated using Normalized Bias NB and Normalized Error NE statistics as the objective function of evaluation The radar overestimated precipitation measurements by average gauges with NB value of 0.41 and a considerably low NE of 0.68 Furthermore the effectiveness of a Deterministic nowcasting system DNS to forecast radar measured precipitation at 132 forecast time series of 6hrs forecast lead time was assessed The DNS overestimated the radar measured precipitation with a NB value of 87% and recorded an accumulated NE of 146% Moreover the efficiencies of 10 ensemble precipitation forecasts generated from a Stochastic nowcasting system SNS over the singular deterministic forecasts from the DNS was evaluated at 3 major hydrological events Some of the ensembles significantly performed better than the deterministic forecast and brilliantly captured the radar measured precipitation at most of the forecast time series Furthermore the efficiencies of these sources of precipitation measurement to simulate flows with the PDM at the Brue catchment were also assessed by integrating the radar based forecasts with measurements from average gauges The PDM performed satisfactorily well in simulating the flows of 17th January 2007 with an average Nash Sutcliffe Efficiency Index NSE of 0.65 and the model was judged insensitive to the significantly high precipitation inputs for the hydrological event of 27th of May 2007 However the PDM performed poorly in simulating flows for the historical storms of 20th of July 2007 with the model under estimating flows with bias value of over 250 cumecs for an event popular for its devastating flooding in the Southwest of England The model inadequacies was however associated to poor radar precipitation measurements and forecasts on which flow simulation was based This work therefore emphasis the need for developments in hydrological modeling as well as advancement in weather radar technology to effectively correct radar errors due to radar calibration signal attenuation clutter and anomalous propagation vertical variation of reflectivity range effects Z R relationships variations of drop size distributions vertical air motions beam overshooting the shallow precipitation and sampling issues that has been identified to affect radar measurements
