The Jet Project and the Prospects for Controlled Nuclear Fusion R. S. Pease, R. J Bickerton, B. E Keen, 1988-09 This volume presents reviews of the principles of the method and engineering realization of JET It describes the promising experimental results so far achieved both in JET and in similar American experiments and compares these results with theory

The Jet Project and the Prospects for Controlled Nuclear Fusion R. S. Pease, 1987 Condensed Matter Nuclear Science - Proceedings Of The 10th International Conference On Cold Fusion Peter L Hagelstein, Scott R Chubb, 2005-12-09 This volume is a collection of papers from the Tenth International Conference on Cold Fusion attended by most of the important groups around the world that are active in the field New results are presented in the area of excess heat production including observations of excess heat correlation of excess heat and helium and laser stimulation of excess heat Nuclear emissions from metal deuterides are put forth by several groups Observations of transmutation including the Iwamura experiment and others are also discussed Updates on theoretical efforts from the different groups are included as well The Nucleus , 1987

Plasma Physics: An Introductory Course R. O. Dendy, 1995-02-24 For the last thirty years international summer schools in plasma physics have been held at Culham Laboratory site of the Joint European Torus fusion project This book has been developed from lectures given at these schools and provides a wide ranging introduction to the subject The first few chapters deal with the fundamentals of plasma physics In subsequent chapters the applications and properties of man made and naturally occurring plasmas are discussed In addition there are chapters devoted to general phenomena such as turbulence and chaos The computational techniques employed in modelling plasma behaviour are also described Since no prior knowledge of plasma physics is assumed this book will act as an ideal introduction to the subject for final year undergraduates and beginning graduate students in physics astronomy mathematics and engineering The JET Project and the Prospects for Controlled Nuclear Fusion , 1987 *Nuclear Fusion* , 1988 **Systems Approaches to Nuclear**

Fusion Reactors Frederick B. Marcus, 2023-01-01 This book offers an overall review applying systems engineering and architecture approaches of the design optimization operation and results of leading fusion experiments These approaches provide a unified means of evaluating reactor design Methodologies are developed for more coherent construction or evaluation of fusion devices associated experiments and operating procedures The main focus is on tokamaks with almost all machines and their important results being integrated into a systems design space Case studies focus on DIII D TCV JET WEST the fusion reactor prototype ITER and the EU DEMO concept Stellarator Mirror and Laser inertial confinement experiments are similarly analysed including reactor implications of breakeven at NIF The book examines the engineering and physics design and optimization process for each machine analysing their performance and major results achieved thus establishing a basis for the improvement of future machines The reader will gain a broad historical and up to date perspective of the status of nuclear fusion research from both an engineering and physics point of view Explanations are

given of the computational tools needed to design and operate successful experiments and reactor relevant machines This book is aimed at both graduate students and practitioners of nuclear fusion science and engineering as well as those specializing in other fields demanding large and integrated experimental equipment Systems engineers will obtain valuable insights into fusion applications References are given to associated complex mathematical derivations which are beyond the scope of this book The general reader interested in nuclear fusion will find here an accessible summary of the current state of nuclear fusion

Physics of Highly-Ionized Atoms Richard Marrus,2012-12-06 The progress in the physics of highly ionized atoms since the last NATO sponsored ASI on this subject in 1982 has been enormous New accelerator facilities capable of extending the range of highly ionized ions to very high Z have come on line or are about to be completed We note particularly the GANIL accelerator in Caen France the Michigan State Superconducting Cyclotrons in East Lansing both of which are currently operating and the SIS Accelerator in Darmstadt FRG which is scheduled to accelerate beam in late 1989 Progress i low energy ion production has been equally dramatic The Lawrence Livermore Lab EBIT device has produced neon like gold and there has been continued improvement in ECR and EBIS sources The scientific developments in this field have kept pace with the technical developments New theoretical methods for evaluating relativistic and QED effects have made possible highly precise calculations of energy levels in one and two electron ions at high Z The calculations are based on the MCDF method and the variational method and will be subject to rigorous experimental tests On the experimental side precision x ray and UV measurements have probed the Lamb shift in the one and two electron ions up to Z 36 with increasing precision
