Remote Sensing of Land Use and Land Cover in Mountain Region Duo Chu, 2019-08-07 This book presents the spatial and temporal dynamics of land use and land cover in the central Tibetan Plateau during the last two decades based on various types of satellite data long term field investigation and GIS techniques Further it demonstrates how remote sensing can be used to map and characterize land use land cover and their dynamic processes in mountainous regions and to monitor and model relevant biophysical parameters The Tibetan Plateau the highest and largest plateau on the Earth and well known as the roof of the world is a huge mountainous area on the Eurasian continent and covers millions of square kilometers with an average elevation of over 4000 m After providing an overview of the background and an introduction to land use and land cover change the book analyzes the current land use status dynamic changes and spatial distribution patterns of different

land use types in the study area using various types of remotely sensed data digital elevation models and GIS spatial analysis methods to do so In turn it discusses the main driving forces based on the main physical environment variables and socioeconomic data and provides a future scenario analysis of land use change using a Markov chain model Given its scope it provides a valuable reference guide for researchers scientists and graduate students working on environmental change in mountainous regions around the globe and for practitioners working at government and non government agencies

Spatio-temporal Analysis and Optimization of Land Use/Cover Change Biao Liu,Bo Huang,Wenting

Zhang,2017-08-07 This book proposes a method to solve land use problems and has made some significant contributions to the land use analysis and optimization study fields Firstly three spatio temporal logit models for land use change analysis namely geographically and temporally weighted logit model GTWLM spatio temporal panel logit model ST PLM and generalized spatio temporal logit model GSTLM are proposed GTWLM which considers spatio temporal non stationarity includes temporal data in a spatio temporal framework by proposing a spatiotemporal distance ST PLM incorporates the spatio temporal correlation and individual effect in one model By integrating GTWLM and ST PLM the GSTLM explores spatio temporal non stationarity and correlations simultaneously whilst considering their individual effects to construct an integrated model Secondly a MOO based two level spatial planning of land use is proposed The spatial planning aims at managing and coordinating the land use at different geographic extents and involves spatial layouts and structures of land use at different levels In spatial planning GIS and Remote Sensing are used to evaluate analyze and measure environmental economic and social issues The quantitative relationships between these objectives and spatial land use allocation are then used as rules in the MOO process to simulate environmental conditions under different spatial land use allocation scenarios The book features a case study of Shenzhen city the most important Special Economic Zone in China This book will be of interest to academics and professionals in the fields of urban planning land resource management remote sensing and geographic information systems

Rovers,2013-03-14 The interaction between environmental change and human activities is complex requiring the concepts and tools of a number of disciplines for its effective analysis Land use and land cover change has only recently become a topic susceptible to scientific research as these concepts and tools have been developed and made available Rooted in a broad community concerned with global change systematic research has begun into land use systems at different scales and interactions and their links with global cycles of water nitrogen and carbon are being explored Partly based on research initiated by the Dutch National Research Programme on Global Air Pollution and Climate Change NRP this book touches upon various land use and land cover issues in relation to global environmental change In addition to the biogeochemical cycles land as a carrier for functions of economic activities food and fibre production and energy production via biomass are discussed Crucial in studying land use is human behaviour

and man environment interaction at different scales Land use and land cover change is an important contributor of greenhouse gasses as these activities directly interfere with the carbon nitrogen and water cycles These cycles are connected through numerous feedback loops The interface of land use and climate is essentially determined by the interaction of man and the environment Man uses land primarily to produce food a relatively small area is needed for urban development
