Carey, Richard J. Sundberg, 2012-12-06 The main theme of Part B is the description of synthetically useful reactions and the illustration of their application We have attempted to update the material to reflect the most important advances in synthetic methodology Because of the extensive developments in the use of organic derivatives of transition metals as well as of silicon and tin we have separated the organometallic material into three chapters Chapter 7 emphasizes organolithium and organomagnesium chemistry and also considers the group IIB metals Transition metal chemistry is discussed in Chapter 8 with emphasis on copper and palladium intermediates In Chapter 9 the carbon carbon bond forming reactions of organoboranes silanes and stannanes are discussed The increased importance of free radical reactions in synthesis has led to the incorporation of a section on radical reactions into Chapter 10 in which carbocations carbenes and nitrenes are also discussed Certainly a major advance in synthetic chemistry during the 1980s was the development of methods for enantioselective synthesis We have increased the level of attention to stereochemistry in the discussion of many reactions In areas in which new stereoselective methods have been well developed such as in aldol condensations hydroboration catalytic reduction and epoxidation we discuss these methods The final chapter discusses some of the general issues which must be addressed in multistep synthesis and provides some illustrative syntheses which can provide the basis for more detailed study of this aspect of synthetic chemistry
