

Radiation heat transfer

Radiation is another fundamental mode of heat transfer. Unlike conduction and convection, radiation heat transfer does not require a medium for transmission as energy transfer occurs due to the propagation of electromagnetic waves. A body due to its temperature emits electromagnetic radiation, and it is emitted at all temperatures. It is propagated with the speed of light (3×10^8 m/s) in a straight line in vacuum. Its speed decreases in a medium but it travels in a straight line in homogenous medium. The speed of light, c is equal to the product of wavelength λ and frequency ν , that is,

$$\lambda \nu = c$$

The wave length is expressed in Angstrom ($1 \text{ \AA} = 10^{-10}$ m) or micron ($1 \mu\text{m} = 10^{-6}$ m). Thermal radiation lies in the range of 0.1 to 100 μm , while visible light lies in the range of 0.35 to 0.75 μm . Propagation of thermal radiation takes place in the form of discrete quanta, each quantum having energy of

$$E = h \nu$$

Where, h is Plank's constant, $h = 6.625 \times 10^{-34}$ Js. The radiation energy is converted into heat when it strikes a body.
