

HOW A HEAT SINK WORKS

Ambient air flows into the heat sink and expels hot air

1. CONDUCTION

Heat from the device moves from the thermal interface material into the heat sink base and up the fins via direct contact

2. CONVECTION

Air molecules are forced between the fins and heat moves from the heat sink into the air before it is expelled out of the device

Remote Viewers Jim Schnabel, 2011-04-20 Remote Viewers is a tale of the Pentagon's attempts to develop the perfect tool for espionage psychic spies. These psychic spies or remote viewers were able to infiltrate any target, elude any form of security and never risk scratch. For twenty years the government selected civilian and military personnel for psychic ability, trained them and put them to work full time at taxpayers' expense against real intelligence targets. The results were so astonishing that the program soon involved more than a dozen separate agencies including the CIA, the Defense Intelligence Agency, the National Security Council, the FBI, the National Security Agency, the Secret Service, the Navy, the Army, the Air Force, the Joint Chiefs of Staff, the Drug Enforcement Agency, the US Customs Service, the US Special Forces Command and at least one Pentagon drug interaction task force. Most of this material is still officially classified. After three years of research with access to numerous sources in the intelligence community including the remote viewers themselves, science writer Jim Schnabel reveals the secret details of the strangest chapter in the history of espionage.

Nuclear plants Maurizio Luigi Cumo, 2017-09-29 This book of the Publishing House of Sapienza University outlines the operative experience of a great number of nuclear power plants and devices of the nuclear fuel cycle. With main reference to nuclear plants of the so-called third generation, i.e. advanced ones of the European Union and of Euratom research Centres, the prospects of future plants of fourth generation, i.e. years 2050s, are also described. Large advancements have been obtained by extended cooperation of EU with USA, Japan and connections with Russia, China, India, Canada and other Countries. After Chernobyl 1986 and Fukushima Daiichi 2011, 3 reactors accidents with heavy consequences, people's interest in nuclear energy decreased all over the world. This book examines in details such accidents to obtain safer designs, Gen IV reactors. In 2003 an initiative of the DOE, USA Department of Energy, launched the so-called Generation IV International Forum with 13 Countries: USA, England, France, Canada, Japan, South Korea, South Africa, Argentina, Brasil, Switzerland, EU with Euratom to design and realise the future reactors of Fourth Generation to substitute third generation reactors at the end of their operative life. Lectors have so a description of the evolution of future reactor types and of prospects that nuclear energy may offer to mankind. Maurizio Luigi Cumo is em. prof. of Nuclear Plants at the University of Rome Sapienza and is member of the Foundation Sapienza Institution which gives prizes to Sapienza top students and may propose to Sapienza Administrative Council new researches to be undertaken. He was engaged in many international nuclear Institutions and Organisations. In years 80s he was engaged in the design of a small medium reactor inherently safe called MARS described in this book. Presently he is in the group of senators and electors of the European Academy of Sciences and Arts of Salzburg representing Italy and is president of SIPS, the Historical 1839 Italian Society for the advancement of sciences.
