The Complete Technology Book on Industrial Polymers, Additives, Colourants and Fillers NIIR Board of Consultants & Engineers, 2006-01-01

The Indian plastic and polymer industry has taken great strides. In the last few decades the industry has grown to the status of a leading sector in the country with a sizable base. The material is gaining notable importance in different spheres of activity and the per capita consumption is increasing at a fast pace. Numerous plastics and fibers are produced from synthetic polymers: containers from propylene, coating materials from PVC, packaging film from polyethylene, experimental apparatus from Teflon, stockings from nylon fiber; there are too many to mention them all. The reason why plastics are popular is that they may offer such advantages as transparency, self-lubrication, light weight, flexibility, economy in fabricating and decorating. Properties of plastics can be modified through the use of fillers, reinforcing agents and chemical additives. Silicones are by far the most important industrial polymers and are based on silicon, an element abundantly available on our planet. Polymers are classified in three broad groups: addition polymers, condensation polymers and special polymers. It is well known that the major consumption of additives is in PVC compounds. Approximately 80% of additives are being used in PVC; however, the left over 20% is consumed in compounding of other thermoplastics. Plastic master batches and fillers have their own importance in plastic processing industries. Colorants are the materials that give colour and opacity to plastics; they are chemically characterized as either pigments or dyes. Pigments are finely pulverized natural or synthetic particles which may be of inorganic or organic origin and insoluble in the matrix in which they are dispersed. Permanent red 2B is a mono azo pigment that is widely used in thermoplastics because it is inexpensive and has high tinting strength and good bleed resistance. Fillers are commonly employed in opaque PVC compounds to reduce cost and to improve electrical insulation properties, to improve deformation resistance of cables, to increase the hardness of a flooring compound and to reduce tackiness of highly plasticized compounds. Various calcium carbonate are used for general purpose work; china clay is commonly employed for electrical insulation and asbestos for flooring applications. Also employed occasionally are the silicas and silicates, talc, light magnesium carbonate and barites, barium sulfate. Polymer Energy system is an award winning innovative proprietary process to convert waste plastics into renewable energy. Polymers are the most rapidly growing sector of the materials industry. No wonder polymers are found in everything from compact discs to high tech aerospace applications. On the basis of value added, Indian share of plastic products industry is about 0.5% of national GDP. Some of the astonishing fundamentals of the book are: industrial polymers, addition polymers, polyolefins, polyethylene, chlorinated polyethylene, cross linked polyethylene, linear low density polyethylene, LLDPE, high molecular weight polyethylene, high density polyethylene, ultrahigh molecular weight polyethylene, polypropylene, polyvinyl chloride, stabilizers, plasticizers, extenders, mineral filled or glass bead milled glass grades, antistatic, electroconductive grades, electroplatable grades, etc. The present book enlightens the processing of industrial polymers, additives, colourant and fillers. This book is an invaluable resource to new entrepreneurs, technocrats.

Handbook of Industrial Water Soluble Polymers Peter A. Williams, 2008-04-15 Natural and synthetic water soluble polymers are used in a wide range of familiar industrial and consumer products including coatings and inks papers adhesives cosmetics and personal care products They perform a variety of functions without which these products would be significantly more expensive less effective or both Written for research development and formulation chemists technologists and engineers at graduate level and beyond in the fine and specialty chemicals polymers food and pharmaceutical industries the Handbook of Industrial Water Soluble Polymers deals specifically with the functional properties of both natural and synthetic water soluble polymers By taking a function based approach rather than a polymer specific approach the book illustrates how polymer structure leads to effect and shows how different polymer types can be employed to achieve appropriate product properties

Industrial Polymers E. Alfredo Campo, 2008 Industrial Polymers provides a comprehensive and very practical overview of the various plastic materials used in today's industrial applications Its focus is on material properties and areas of application All industrially significant plastic families and grades are introduced following the same approach their chemical constitution manufacturing properties processing and end use applications The consistent presentation allows easy comparison of different materials for the reader and will help with the initial identification of suitable plastic materials for a given end use Ample full color illustrations are testimony to the fact that plastic materials are the ultimate tribute to man's creativity and inventiveness

Materials Processing Lorraine F. Francis, 2024-04-25 Materials Processing A Unified Approach to Processing of Metals Ceramics and Polymers Second Edition is the first textbook to bring the fundamental concepts of materials processing together in a unified approach that highlights the overlap in scientific and engineering principles It teaches students the key principles involved in the processing of engineering materials specifically metals ceramics and polymers from starting or raw materials through to the final functional forms Its self contained approach is based on the state of matter most central to the shaping of the material melt

solid powder dispersion and solution and vapor With this approach students learn processing fundamentals and appreciate the similarities and differences between the materials classes This fully updated edition includes expanded coverage on additive manufacturing as well as adding a new section on machining The organization has been modified and a greater emphasis has been placed on the fundamentals of processing and manufacturing methods This book can be utilized by upper level undergraduates and beginning graduate students in Materials Science and Engineering who are already schooled in the structure and properties of metals ceramics and polymers and are ready to apply their knowledge to materials processing It will also appeal to students from other engineering disciplines who have completed an introductory materials science and engineering course Includes comprehensive coverage on the fundamental concepts of materials processing Provides coverage of metals ceramics and polymers in one text Presents examples of both standard and newer additive manufacturing methods throughout Gives students an overview on the methods that they will likely encounter in their careers
