Intravascular Infections Lawrence R. Freedman, 2012-12-06 The most important example of intravascular infection is infective endocarditis IE a common and serious disorder in man In the past these infections were uniformly fatal but since the development of potent antimicrobial agents bacteriological cure has become practical and predictable So for a while it seemed that intravascular infection would diminish in importance and be relegated to the stockpile of illnesses which physicians one or two generations earlier used to see frequently In recent years however spectacular technological advances cardiac surgery intravascular devices hemodialysis accompanied by profound social deterioration intravenous drug usage have provided new breeding grounds for the development of these infections So it is that a large percentage of intravascular infections may be looked upon today as one of the diseases of medical progress and social evolution This progress however has not only contributed to the encouragement of the disease there is another side to the coin the same technological advances that have served to increase the frequency of infection e g intravascular plastic catheters have also led to the first simple easily reproducible laboratory animal model for the study of the disease thus advancing our understanding of the prophylaxis treatment and general biology of these infections Figures 1 and 2 Similarly whereas the insertion of prosthetic heart valves has created a new group of patients with endocarditis these same surgical techniques are lifesaving to patients with endocarditis whose aortic valves have perforated
