Information Theory And The Central Limit Theorem:

Information Theory and the Central Limit Theorem Oliver Johnson, 2004 Annotation Presents surprising interesting connections between two apparently separate areas of mathematics Written by one of the researchers who discovered these connections Offers a new way of looking at familiar results

Information Theory and the Central Limit Theorem Oliver Thomas Johnson, 2004 This book provides a comprehensive description of a new method of proving the central limit theorem through the use of apparently unrelated results from information theory It gives a basic introduction to the concepts of entropy and Fisher information and collects together standard results concerning their behaviour It brings together results from a number of research papers as well as unpublished material showing how the techniques can give a unified view of limit theorems

Introduction to Matrix Analysis and Applications Fumio Hiai, Dénes Petz, 2014-02-06 Matrices can be studied in different ways They are a linear algebraic structure and have a topological analytical aspect for example the normed space of matrices and they also carry an order structure that is induced by positive semidefinite matrices The interplay of these closely related structures is an essential feature of matrix analysis This book explains these aspects of matrix analysis from a functional analysis point of view After an introduction to matrices and functional analysis it covers more advanced topics such as matrix monotone functions matrix means majorization and entropies Several applications to quantum information are also included *Introduction to Matrix Analysis and Applications* is appropriate for an advanced graduate course on matrix analysis particularly aimed at studying quantum information It can also be used as a reference for researchers in quantum information statistics engineering and economics

Probability Theory Alfred Renyi, 2007-05-11 The founder of Hungary's Probability Theory School A. Rényi made significant contributions to virtually every area of mathematics This introductory text is the product of his extensive teaching experience and is geared toward readers who wish to learn the basics of probability theory as well as those who wish to attain a thorough knowledge in the field Based on the author's lectures at the University of Budapest this text requires no preliminary knowledge of probability theory Readers should however be familiar with other branches of mathematics including a thorough understanding of the elements of the differential and integral calculus and the theory of real and complex functions These well chosen problems and exercises illustrate the algebras of events discrete random variables characteristic functions and limit theorems The text concludes with an extensive appendix that introduces information theory

Entropy, Search, Complexity Imre Csizsár, Gyula O.H. Katona, Gabor Tardos, 2007-04-05 The present volume is a collection of survey papers in the fields given in the title They summarize the latest developments in their respective areas More than half of the papers belong to search theory which lies on the borderline of mathematics and computer science information theory and combinatorics respectively The volume is slightly related to the twin conferences Search And Communication Complexity and Information Theory In Mathematics held at Balatonlelle Hungary in 2000 These conferences led us to believe that there is a need for such a collection of papers The paper written by Martin Aigner starts with the following relatively new search problem Given n boolean variables as input one has to find one of them whose value is in majority The goal is to minimize the number of tests needed for this where one test is to compare two input variables for equality The paper surveys the large set of problems and results which grew out of this one In the traditional search model an unknown element is sought in a finite set based on the information that the unknown element is or is not in some asked subsets A variant is when a 0-1 function is given on the underlying set and only the values of this function at the unknown element x is sought rather than x itself This is called the recognition problem

Gene Expression and Its Discontents Rodrick Wallace, Deborah Wallace, 2009-10-30 Gene Expression and its Discontents examines a class of probability models describing how epigenetic context affects gene expression and organismal development using the asymptotic limit theorems of information theory in a highly formal manner Taking classic results on spontaneous symmetry breaking abstracted from statistical physics in groupoid rather than group circumstances the work suggests that epigenetic information sources act as analogs to a tunable catalyst directing development into different characteristic pathways according to the structure of external signals The results have significant implications for epigenetic epidemiology in particular for understanding how environmental stressors in a large sense can induce a broad spectrum of developmental disorders in humans The authors then apply the perspective to a number of chronic diseases broadly associated with obesity using data at different scales of observation
