Industrial Steam:

British Industrial Steam Locomotives David Mather, 2020-09-30 A pictorial history of the many producers of industrial steam locomotives in Great Britain from the early nineteenth century to the mid twentieth century The first steam locomotives used on any British railway worked in industry The use of new and second hand former main line locomotives was once a widespread aspect of the railways of Britain This volume covers many of the once numerous manufacturers who constructed steam locomotives for industry and contractors from the nineteenth to the mid twentieth centuries David Mather has spent many years researching and collecting photographs across Britain of most of the different locomotive types that once worked in industry This book is designed to be both a record of these various manufacturers and a useful guide to those researching and modelling industrial steam Praise for British Industrial Steam Locomotives A good introduction hopefully it will encourage some of those who have only been involved during the preservation period to take a wider interest in the historical aspects of the subject Industrial Locomotive Society **Industrial Steam in Britain** Stephen Heginbotham, 2022-10-15 Explore richly rewarding and nostalgic photographs of the heyday of steam on Britain's industrial Colonial Extraction and Industrial Steam Power, 1790-1880 Liz Conor, 2024-07-24 This book untangles the railways connections between British industrialization and colonial expansion in the late eighteenth and nineteenth centuries The addition of fossil fuels to the energy mix in this period drove overwhelming social and economic change in Britain the north east United States and Europe but it also had important and uneven consequences within a range of Euro American colonies Opening a new field of inquiry into fossil fuel powered technologies and their critical role in colonial expansion this book demonstrates how carbon based economies dramatically accelerated the annexing of foreign lands and the extraction of their resources Yet while the use of coal on a commercial scale from the late 1700s powered an explosion of growth in manufacturing between 1760 and 1840 and these years coincided with the incursion and violence on colonial frontiers the peripheries tended to rely on wood where they could This intensification of animal and timber power complicated the nationalist narratives of coal fired industrialization and economic development A history of the meanings and ideas around carbon fossil fuels and their bearing within colonial expansion is increasingly relevant as rapid changes to climate bring into focus the legacy of carbonization in dispossession sustainability environmental labor and atmospheric relational histories

The operating cost of a typical Plant Utility System of a typical Industrial Production Process Plant is enormous often in tens if not hundreds of millions of dollars per Annum With so much money at stake one would expect that heroic optimization efforts would be made to reduce the operating cost however such is usually not the case One reason for this complacency is that Plant Utility Systems are usually cost centers in Process Plants and their operating cost is prorated amongst the various Production Units so it suffers from what is at times referred to as the tragedy of the commons Another reason for this complacency is that the Plant Utility System structure is significantly different than that of other Production Units as for flexibility and safety reasons it has a large spare capacity to meet increased utility demand during startups shutdowns and emergencies The existence of a spare equipment necessitates optimization of discrete decisions whereby traditional optimization techniques do not readily apply Part of the problem is that the traditional engineering curriculum primarily emphasizes only one of the many optimization methods called Non Linear Programming NLP Although NLP can address large classes of optimization problems it has fairly stringent requirements that all describing relationships or functions be continuous and have continuous derivatives Additionally in general NLP only guarantees a local but not the global optimum Another optimization method is particularly well suited for modeling Plant Utility Systems is called Mixed Integer Linear Programming MILP And unlike NLP MILP methods can guarantee global optimum which is very reassuring MILP however does impose linearity requirements but as discussed in this book there are techniques to overcome this limitation
