Computer Literature Bibliography: 1964-1967 W. W. Youden, 1965      *NBS Special Publication*, 1968      **THE INTELLIGENCE OF MACHINES** Patrick K. Kalifungwa, 2024-11-13

In a 1951 lecture Turing Alan 1951 Turing argued It seems probable that once the machine thinking method had started it would not take long to outstrip our feeble powers There would be no question of the machines dying and they would be able to converse with each other to sharpen their wits At some stage therefore we should have to expect the machines to take control in the way that is mentioned in Samuel Butler's *Erewhon* Also in a lecture broadcast on the BBC Turing Alan 1951 He expressed the opinion If a machine can think it might think more intelligently than we do and then where should we be Even if we could keep the machines in a subservient position for instance by turning off the power at strategic moments we should as a species feel greatly humbled This new danger is certainly something which can give us anxiety as interpreted by Seth Baum Hubert Dreyfus writes In general by accepting the fundamental assumptions that the nervous system is part of the physical world and that all physical processes can be described in a mathematical formalism which can in turn be manipulated by a digital computer one can arrive at the strong claim that the behavior which results from human information processing whether directly formalizable or not can always be indirectly reproduced on a digital machine Dreyfus 1972 John Searle writes Could a man made machine think Assuming it possible produce artificially a machine with a nervous system the answer to the question seems to be obviously yes Could a digital computer think If by digital computer you mean anything at all that has a level of description where it can be correctly described as the instantiation of a computer program then again the answer is of course yes since we are the instantiations of any number of computer programs and we can think Searle 1980      **The Dream Machine** M. Mitchell Waldrop, 2018-09-25 The story of the man who instigated the work that led to the internet and shifted our understanding of what computers could be Behind every great revolution is a vision and behind perhaps the greatest revolution of our time personal computing is the vision of J C R Licklider He did not design the first personal computers or write the software that ran on them nor was he involved in the legendary early companies that brought them to the forefront of our everyday experience He was instead a relentless visionary that saw the potential of the way individuals could interact with computers and software At a time when computers were a short step removed from mechanical data processors Licklider was writing treatises on human computer symbiosis computers as communication devices and a now not so unfamiliar Intergalactic Network His ideas became so influential his passion so contagious that Waldrop called him computing's Johnny Appleseed In a simultaneously compelling personal narrative and comprehensive historical exposition Waldrop tells the story of the man who not only instigated the work that led to the internet but also shifted our understanding of what computers were and could be Included in this edition are also the original texts of Licklider's three most influential writings *Man computer symbiosis* 1960 which outlines the vision that inspired the personal computer revolution of the 1970s his *Intergalactic*

Network memo 1963 which outlines the vision that inspired the internet and The computer as a communication device 1968 co authored with Robert Taylor which amplifies his vision for what the network could become National Science Research Data Processing and Information Retrieval System, Hearings Before the General Subcommittee on Education....91-1, on H.R. 8809, April 29, 30, 1969 United States. provides a unique introduction to identity and reference theories of the World Wide Web through the academic lens of philosophy of language and data driven statistical models The Semantic Web is a natural evolution of the Web and this book covers the URL based Web architecture and Semantic Web in detail It has a robust empirical side which has an impact on industry Social Semantics The Search for Meaning on the Web discusses how the largest problem facing the Semantic Web is the problem of identity and reference and how these are the results of a larger general theory of meaning This book hypothesizes that statistical semantics can solve these problems illustrated by case studies ranging from a pioneering study of tagging systems to using the Semantic Web to boost the results of commercial search engines Social Semantics The Search for Meaning on the Web targets practitioners working in the related fields of the semantic web search engines information retrieval philosophers of language and more Advanced level students and researchers focusing on computer science will also find this book valuable as a secondary text or reference book *Handbook for Automatic Computation* Albert A. Grau, U. Hill, H. Langmaack, 2012-12-06 Problem oriented programming languages as they have developed over the last ten years essentially serve two purposes which somewhat crudely can be described by the terms man man communication and man machine communication respectively As a carrier of information between humans the problem oriented programming language is designed to express the essence of an algorithm in a way which is unambiguous and concise as well as independent of and therefore meaningful without any reference to the changing details of computing machinery As a carrier of information from man to computer the language permits the human programmer to express his computational needs in a compact way adapted to the general characteristics of computers but freed from the burdening details of specific computer facilities This presupposes the existence of algorithms or programs which permit the computer itself to transform efficiently programs written in the problem oriented language into machine programs Thus the entire computing community profits from the work of the individual programmer The primary purpose of the Handbook is to present a set of algorithms of broad utility from the domain of numerical mathematics written in the problem oriented language ALGOL 60 Therefore volumes I a and I b are in a sense supplementary as they serve to introduce this language Volume I a gives a description of the language proper and of its use for writing correct programs Thus volume I a primarily covers the aspect of man man communication by means of ALGOL 60
