Information Theory Papers:

Key Papers in the Development of Information Theory David Slepian, 1974 **Information, Randomness & Incompleteness: Papers On Algorithmic Information Theory** Gregory J Chaitin, 1987-12-18 The papers gathered in this book were published over a period of more than twenty years in widely scattered journals They led to the discovery of randomness in arithmetic which was presented in the recently published monograph on Algorithmic Information Theory by the author There the strongest possible version of G del s incompleteness theorem using an information theoretic approach based on the size of computer programs was discussed The present book is intended as a companion volume to the monograph and it will serve as a stimulus for work on complexity randomness and unpredictability in physics and biology as well as in metamathematics **Information Theory** Sir Willis Jackson, Colin Cherry, 1953 **Selected Papers of Hirotugu Akaike** Emanuel Parzen, Kunio Tanabe, Genshiro Kitagawa, 2012-12-06 The pioneering research of Hirotugu Akaike has an international reputation for profoundly affecting how data and time series are analyzed and modelled and is highly regarded by the statistical and technological communities of Japan and the world His 1974 paper A new look at the statistical model identification IEEE Trans Automatic Control AC 19 716 723 is one of the most frequently cited papers in the area of engineering technology and applied sciences according to a 1981 Citation Classic of the Institute of Scientific Information It introduced the broad scientific community to model identification using the methods of Akaike s criterion AIC The AIC method is cited and applied in almost every area of physical and social science The best way to learn about the seminal ideas of pioneering researchers is to read their original papers This book reprints 29 papers of Akaike s more than 140 papers This book of papers by Akaike is a tribute to his outstanding career and a service to provide students and researchers with access to Akaike s innovative and influential ideas and applications To provide a commentary on the career of Akaike the motivations of his ideas and his many remarkable honors and prizes this book reprints A Conversation with Hirotugu Akaike by David F Findley and Emanuel Parzen published in 1995 in the journal Statistical Science This survey of Akaike s career provides each of us with a role model for how to have an impact on society by stimulating applied researchers to implement new statistical methods **Thinking about G del and Turing** Gregory J. Chaitin, 2007 Dr Gregory Chaitin one of the world s leading mathematicians is best known for his discovery of the remarkable number a concrete example of irreducible complexity in pure mathematics which shows that mathematics is infinitely complex In this volume Chaitin discusses the evolution of these ideas tracing them back to Leibniz and Borel as well as G del and Turing This book contains 23 non technical papers by Chaitin his favorite tutorial and survey papers including Chaitin s three Scientific American articles These essays summarize a lifetime effort to use the notion of program size complexity or algorithmic information content in order to shed further light on the fundamental work of G del and Turing on the limits of mathematical methods both in logic and in computation Chaitin argues here that his information theoretic approach to metamathematics suggests a quasi

empirical view of mathematics that emphasizes the similarities rather than the differences between mathematics and physics He also develops his own brand of digital philosophy which views the entire universe as a giant computation and speculates that perhaps everything is discrete software everything is 0 s and 1 s Chaitin s fundamental mathematical work will be of interest to philosophers concerned with the limits of knowledge and to physicists interested in the nature of complexity

Collected Works (volume 1): Published Papers Stephen Luttrell,2023-10-24 The motivation for the research that is described in these volumes is the wish to explain things in terms of their underlying causes rather than merely being satisfied with phenomenological descriptions When this reductionist approach is applied to information processing it allows the internal structure of information to be analysed so information processing algorithms can then be derived from first principles One of the simplest examples of this approach is the diagonalisation of a data covariance matrix there are many variants of this basic approach such as singular value decomposition in which the assumed independent components of high dimensional data are identified and extracted The main limitation of this type of information analysis approach is that it is based on linear algebra applied globally to the data space so it is unable to preserve information about any local data structure in the data space For instance if the data lives on a low dimensional curved manifold embedded in the data space then only the global properties of this manifold would be preserved by global linear algebra methods In practice data whose high dimensional structure is non trivial typically lives on a noisy version of a curved manifold so techniques for analysing such data must automatically handle this type of structure For instance a blurred image of a point source is described by its underlying degrees of freedom i e the position of the source and as the source moves about it generates a curved manifold that lives in the high dimensional space of pixel values of the sampled image The basic problem is then to deduce the internal properties of this manifold by analysing examples of such images A more challenging problem would be to extend this analysis to images that contain several overlapping blurred images of point sources and so on There is no limit to the complexity of the types of high dimensional data that one might want to analyse These methods then need to be automated so that they do not rely on human intervention which would then allow them to be inserted as components into information processing networks The purpose of the research that is described in these volumes is to develop principled information processing methods that can be used for such analysis Self organising information processing networks arise naturally in this context in which ways of cutting up the original manifold into simpler pieces emerge automatically

James V. Stone,2012-09-21 An engaging introduction to the science of vision that offers a coherent account of vision based on general information processing principles In this accessible and engaging introduction to modern vision science James Stone uses visual illusions to explore how the brain sees the world Understanding vision Stone argues is not simply a question of knowing which neurons respond to particular visual features but also requires a computational theory of vision Stone draws together results from David Marr s computational framework Barlow s efficient coding hypothesis Bayesian inference Shannon s information theory and signal processing to construct a coherent account of vision that explains not only how the brain is fooled by particular visual illusions but also why any biological or computer vision system should also be fooled by these illusions This short text includes chapters on the eye and its evolution how and why visual neurons from different species encode the retinal image in the same way how information theory explains color aftereffects how different visual cues provide depth information how the imperfect visual information received by the eye and brain can be rescued by Bayesian inference how different brain regions process visual information and the bizarre perceptual consequences that result from damage to these brain regions The tutorial style emphasizes key conceptual insights rather than mathematical details making the book accessible to the nonscientist and suitable for undergraduate or postgraduate study *Visions in Mathematics*
