Intelligent Design using Solar-Climatic Vision Samimi, Mojtaba, Nasrollahi, Farshad, 2014-07-22 Thanks to the availability of energy materials and technologies the level of comfort in buildings is increasing around the world However today we are also facing buildings and cities that are responsible for a high percentage of global energy consumption Pollution heat island effect climate change and global warming are just a few of the challenges that the human race as well as other living matter on earth will have to deal with in future Moreover as time goes by we may not necessarily live in healthier conditions with better life styles Within a limited period this global and complex situation will need thorough integrated and local surgery This book is designed to draw greater attention to the sun and how a solar climatic vision can influence and improve architectural design and urban planning It may not have been discovered yet how small our planet is and how big the effect of a simple decision can be but it is nevertheless important to be reminded of the sun not only as a powerful and perpetual actor in our dynamic atmosphere but also as a basis for figuring out a variety of adaptive solutions that must be identified and followed In addition to the changes made by architects clients and builders as well as planners municipalities and all other persons who make decisions on plans the role of those who live inside buildings and cities not as users but as producers and maintainers also bear a certain degree of responsibility Therefore the optimization of new constructions the modification of existing buildings and urban fabric should be considered on a global scale in regard to the sun as well as our future needs The aim should be to improve energy efficiency health comfort and safety in all living spaces whether indoors or outdoors In this respect the analysis of the current situation forecasting future scenarios and the development of intelligent alternatives are fundamental steps In terms of energy efficiency daylight provision and internal comfort the use of advanced building materials and technologies as well as simulation tools can improve the building envelope and its performance However it is important to understand when where and how they should best be applied to achieve an intelligent form as well as a responsive layout with a high level of performance for other essential aspects too e g structure view operation Although today many consider solar architecture the attaching of solar

thermal collectors and PVs to building roofs and facades this is only one of the complex tasks which should be integrated in the design In fact solar architecture incorporates all the complexities of architecture on different scales Besides it has to respond accurately to certain issues resulting from the currently low price of other energy sources in many locations In addition to the reduction of payments other valuable improvements associated with solar climatic considerations in the design should be clarified and compared During the design process an optimization i e re arrangement re orientation re sizing of different elements namely solar surfaces i e transparent opaque surfaces shading reflecting devices collectors building volumes and trees does not necessarily increase the construction costs but can help identify deficient or over designed elements Alongside improving the energy efficiency aspects of individual buildings a solar climatic vision in planning can lead to other qualities for the benefit of small and large scale living spaces whether indoors or outdoors Around the world we must be prepared for more shocking news and annual records if many continue to build buildings whether cheap or expensive with little attention to the sun In neighborhoods on an urban scale the insufficient analysis and inaccurate decisions regarding building volumes and orientation can affect the potentials and performance of both internal and external spaces in terms of energy production energy demand daylight health comfort and safety for long periods of time This book includes a decade of SOLARCHVISION practices on how architectural design and urban planning can be adapted by the constant path and variable effects of the sun in each location Sharing such a vision can help architects urban planners and clients to make more accurate decisions concerning energy and climate related matters After presenting fundamental diagrams in different cities around the world e g the sun paths solar radiation and temperature models the role of an intelligent design for the building skin is described and analyzed in terms of finding a good relation between outside and inside as well as the direct and indirect collection of solar energy on different building surfaces This research can bring about new appearances and structures for the creation of smart buildings and responsive cities Aufgrund der Verfügbarkeit von Energie Materialien und Technologien erhöht sich der Wohnkomfort in Gebäuden weltweit Jedoch stehen wir auch vor dem Problem dass Gebäude und Städte für einen hohen Anteil des weltweiten Energieverbrauchs verantwortlich sind Umweltverschmutzung Wärmeeffekte Klimawandel und globale Erwärmung sind nur einige der vielen Herausforderungen mit denen die menschliche Rasse ebenso sowie alles weitere Leben auf der Erde in Zukunft umgehen muss In absehbarer Zeit wird diese komplexe globale Situation grundlegende ganzheitliche und rechtliche Eingriffe erfordern Dieses Buch richtet die Aufmerksamkeit auf die Sonne und dadurch auch darauf wie ein solarklimatisches Konzept die Architektur und Stadtplanung beeinflussen und verbessern kann Es ist vielleicht noch nicht entdeckt worden wie klein unser Planet doch eigentlich ist und wie groß der Einfluss einer einfachen Entscheidung sein kann aber vor allem ist es wichtig dass die Sonne eine wichtige und immer wachsende Rolle in unserer dynamischen Atmosphäre spielt und dies als Grundlage bei der Suche von Lösungsmöglichkeiten erkannt und angewandt wird Neben Architekten Kunden und Bauherren sowie Planern

Kommunen und allen anderen Personen die Entscheidungen bei der Planung treffen spielen die in den Gebäuden und Städten Lebenden auch eine Rolle nicht als Nutzer sondern als Erzeuger und Betreuer und auch sie haben eine gewisse Verantwortung. Daher sollten alle Optimierungen neuer Bauten Modifikationen von Bestandsgebäuden und Stadtstrukturen auf globaler Ebene Bezug auf die Sonne und auf zukünftige Bedürfnisse nehmen. Das Ziel sollte es sein die Energieeffizienz Gesundheit Komfort und Sicherheit in allen Lebensräumen ob drinnen oder draußen zu verbessern. In dieser Hinsicht sind die Analyse der aktuellen Situation die Prognose zukünftiger Szenarien und die Entwicklung intelligenter Alternativen grundlegende Schritte. Der Einsatz von modernen Baustoffen und Technologien sowie Simulationswerkzeugen kann die Energieeffizienz und Leistungsfähigkeit eines Gebäudes verbessern. Es ist jedoch wichtig zu verstehen wann wo und wie sie am besten in der architektonischen Gestaltung angewendet werden können um ein ansprechendes Layout mit einer hohen Leistung für eine Vielzahl von architektonischen Aspekten zu erreichen und in Bezug auf Energieeffizienz Tageslichtversorgung und internen Komfort ein optimales Ergebnis zu erzielen. Obwohl heute viele schon das Anbringen von Solar Kollektoren und PV Modulen auf Gebäuden und Fassaden als Solararchitektur betrachten ist dies nur eine der komplexen Aufgaben in diesem Feld der Architektur. Tatsächlich beinhaltet die Solararchitektur die gesamte Komplexität der Architektur auf unterschiedlichen Ebenen. Außerdem hat sie sehr genau auf bestimmte Sachverhalte zu reagieren welche aus den vielerorts aktuell geringen Energiekosten anderer Energiequellen resultieren. Neben der Reduzierung von Baukosten sollten andere wertvolle Verbesserungen resultierend aus solar klimatischen Überlegungen im Entwurf hervorgehoben und verglichen werden. In der Tat kann eine Optimierung verschiedener Elemente während des Design Prozesses wie z.B. Solarflächen Baukörpern und Räumen nicht notwendigerweise die Baukosten steigern jedoch dabei helfen unnötige oder überdimensionierte Elemente zu identifizieren. Neben der Verbesserung der Energieeffizienzaspekte einzelner Gebäude kann eine zuverlässige integrierte solarklimatische Planung zu weiteren Qualitäten der Lebensräume führen. Überall auf der Welt müssen wir uns auf mehr und mehr schockierende Nachrichten und jährliche Rekordwerte vorbereiten wenn weiterhin viele Gebäude mit wenig Aufmerksamkeit auf die Sonne gebaut werden. In Stadtteilen auf urbaner Städteebene kann die unzureichende Analyse und unklare Entscheidungen bei Baukörper und Orientierung die Potenziale und Leistung interner und externer Räume im Bezug auf Energieproduktion Energiebedarf Tageslicht Gesundheit Komfort und Sicherheit auf lange Zeit beeinflussen. Dieses Buch enthält ein Jahrzehnt SOLARCHVISION Praktiken darüber wie die Architektur und Stadtplanung mit dem konstanten Weg und den variablen Auswirkungen der Sonne an jedem Standort angepasst werden kann. Das Teilen dieser Vision kann Architekten Stadtplanern und Kunden helfen zielgenauere Entscheidungen bei energie und klimarelevante Fragen zu treffen. Nach der Vorstellung grundlegender Diagramme zu verschiedenen Städten auf der ganzen Welt z.B. die Sonnenwege Sonneneinstrahlung und Temperaturmodelle wird die Rolle eines intelligenten Designs für die Gebäudehülle beschrieben und analysiert im Hinblick auf die Suche nach einer guten Verbindung zwischen Außen und Innen sowie

die direkte und indirekte Nutzung von Sonnenenergie auf verschiedenen Gebüden. Diese Untersuchungen können neue Ansichten und Strukturen für die Erbauung intelligenter Gebäude und anpassungsfähiger Städte hervorbringen.
