*High Frequency and Pulse Scattering* Allan D. Pierce, R. N. Thurston, 2013-10-22 High Frequency and Pulse Scattering investigates high frequency and pulse scattering with emphasis on the phenomenon of echoes from objects Geometrical and catastrophe optics methods in scattering are discussed along with the scattering of sound pulses and the ringing of target resonances Caustics and associated diffraction catastrophes are also examined Comprised of two chapters this volume begins with a detailed account of geometrically based approximation methods in scattering theory focusing on waves transmitted through fluid and elastic scatterers and glory scattering surface ray representations of scattering by shells and other smooth objects and caustics and associated diffraction catastrophes The second chapter deals with the relation between sound pulses and the vibrational spectra of elastic submerged objects The theory of the scattering of sound pulses from elastic and impenetrable objects is described together with the theory of surface wave pulses Target resonances and the singularity expansion method are also analyzed This book will be of interest to physicists

Advances in space borne remote sensing have significantly changed the mankind viewpoint how to observe our own Earth planet. Great amount of remote sensing data and images presents new resources to quantitatively describe and monitor our Earth environment: atmosphere, oceanic and land surfaces. In remote sensing, electromagnetic (EM) scattering, emission and wave propagation as interaction with the Earth environment lay the physical basis for understanding and extracting geoscientific information. Study of electromagnetic waves with remote sensing application has become an active and interdisciplinary area. This book presents some new progress on the theoretical and numerical approaches for information retrieval of the remote sensing via EM scattering and emission. We begin in Chapter 1 with the vector radiative transfer (VRT) theory for inhomogeneous scatter media. The VRT takes account of multiple scattering, emission and propagation of random scatter media and quantitatively leads to insights of elucidating and understanding EM wave terrain surface interaction. Meanwhile, it is extensively applicable to carrying out data interpretation and validation and to solving the inverse problem, e.g., iteratively physically or statistically. In Chapter 1, iterative solutions of multiple scattering and emission from inhomogeneous dense scatter media and inhomogeneous non-spherical scatter media are discussed. Three-dimensional VRT equation (3D VRT) for spatially inhomogeneous random scatter media for high resolution observation is also investigated. The polarimetric imagery of synthetic aperture radar (SAR) technology is one of most important advances in space borne microwave remote sensing during recent decades.
