## Higher Operads Higher Categories:

**Higher Operads, Higher Categories** Tom Leinster, 2004-07-22 Foundations of higher dimensional category theory for graduate students and researchers in mathematics and mathematical physics

**Higher Operads, Higher Categories** Tom Leinster, 2004-07-22 Category theory has experienced a resurgence in popularity recently because of new links with topology and mathematical physics This book provides a clearly written account of higher order category theory and presents operads and multicategories as a natural language for its study Tom Leinster has included necessary background material and applications as well as appendices containing some of the more technical proofs that might have disrupted the flow of the text

On Operads, Bimodules and Analytic Functors Nicola Gambino, André Joyal, 2017-09-25 The authors develop further the theory of operads and analytic functors In particular they introduce the bicategory of operad bimodules that has operads as cells operad bimodules as cells and operad bimodule maps as 2 cells and prove that it is cartesian closed In order to obtain this result the authors extend the theory of distributors and the formal theory of monads

**Elements of  $\infty$ -Category Theory** Emily Riehl, Dominic Verity, 2022-02-10 This book develops the theory of infinite dimensional categories by studying the universe or cosmos in which they live

*Towards the Mathematics of Quantum Field Theory* Frédéric Paugam, 2014-02-20 This ambitious and original book sets out to introduce to mathematicians even including graduate students the mathematical methods of theoretical and experimental quantum field theory with an emphasis on coordinate free presentations of the mathematical objects in use This in turn promotes the interaction between mathematicians and physicists by supplying a common and flexible language for the good of both communities though mathematicians are the primary target This reference work provides a coherent and complete mathematical toolbox for classical and quantum field theory based on categorical and homotopical methods representing an original contribution to the literature The first part of the book introduces the mathematical methods needed to work with the physicists spaces of fields including parameterized and functional differential geometry functorial analysis and the homotopical geometric theory of non linear partial differential equations with applications to general gauge theories The second part presents a large family of examples of classical field theories both from experimental and theoretical physics while the third part provides an introduction to quantum field theory presents various renormalization methods and discusses the quantization of factorization algebras

**Mathematical Foundations of Quantum Field Theory and Perturbative String Theory** Hisham Sati, Urs Schreiber, 2011-12-07 Conceptual progress in fundamental theoretical physics is linked with the search for the suitable mathematical structures that model the physical systems Quantum field theory QFT has proven to be a rich source of ideas for mathematics for a long time However fundamental questions such as What is a QFT did not have satisfactory mathematical answers especially on spaces with arbitrary topology fundamental for the formulation of perturbative string theory This book contains a collection of papers highlighting the mathematical foundations of QFT and its relevance to

perturbative string theory as well as the deep techniques that have been emerging in the last few years The papers are organized under three main chapters Foundations for Quantum Field Theory Quantization of Field Theories and Two Dimensional Quantum Field Theories An introduction written by the editors provides an overview of the main underlying themes that bind together the papers in the volume *Topics in Noncommutative Geometry* Guillermo Cortiñas, 2012 Luis Santalo Winter Schools are organized yearly by the Mathematics Department and the Santalo Mathematical Research Institute of the School of Exact and Natural Sciences of the University of Buenos Aires FCEN This volume contains the proceedings of the third Luis Santalo Winter School which was devoted to noncommutative geometry and held at FCEN July 26 August 6 2010 Topics in this volume concern noncommutative geometry in a broad sense encompassing various mathematical and physical theories that incorporate geometric ideas to the study of noncommutative phenomena It explores connections with several areas including algebra analysis geometry topology and mathematical physics Bursztyn and Waldmann discuss the classification of star products of Poisson structures up to Morita equivalence Tsygan explains the connections between Kontsevich's formality theorem noncommutative calculus operads and index theory Hoefel presents a concrete elementary construction in operad theory Meyer introduces the subject of  $C^*$  algebraic crossed products Rosenberg introduces Kasparov's KK theory and noncommutative tori and includes a discussion of the Baum Connes conjecture for K theory of crossed products among other topics Lafont Ortiz and Sanchez Garcia carry out a concrete computation in connection with the Baum Connes conjecture Zuk presents some remarkable groups produced by finite automata Mesland discusses spectral triples and the Kasparov product in KK theory Trinchero explores the connections between Connes noncommutative geometry and quantum field theory Karoubi demonstrates a construction of twisted K theory by means of twisted bundles Tabuada surveys the theory of noncommutative motives Mathematics of Program Construction Dexter Kozen, Carron Shankland, 2004-06-24 This book constitutes the refereed proceedings of the 7th International Conference on the Mathematics of Program Construction MPC 2004 held in Stirling Scotland UK in July 2004 The 19 revised full papers presented were carefully reviewed and selected from 37 submissions Among the topics addressed are programming theory programming methodology program specification program transformation programming paradigms programming calculi and programming language semantics *Human-Like Biomechanics* Vladimir G. Ivancevic, Tijana T. Ivancevic, 2008-01-11 Human Like Biomechanics is a comprehensive introduction into modern geometrical methods to be used as a unified research approach in two apparently separate and rapidly growing fields mathematical biomechanics and humanoid robotics The book contains six Chapters and an Appendix The first Chapter is an Introduction giving a brief review of mathematical techniques to be used in the text The second Chapter develops geometrical basis of human like biomechanics while the third Chapter develops its mechanical basis mainly from generalized Lagrangian and Hamiltonian perspective The fourth Chapter develops topology of human like biomechanics while the fifth Chapter reviews related

nonlinear control techniques The sixth Chapter develops covariant biophysics of electro muscular stimulation The Appendix consists of two parts classical muscular mechanics and modern path integral methods which are both used frequently in the main text The whole book is based on the authors own research papers in human like biomechanics

**Geometrical Dynamics of Complex Systems** Vladimir G. Ivancevic, Tijana T. Ivancevic, 2006-09-10 Geometrical Dynamics of Complex Systems is a graduate level monographic textbook It represents a comprehensive introduction into rigorous geometrical dynamics of complex systems of various natures By complex systems in this book are meant high dimensional nonlinear systems which can be but not necessarily are adaptive This monograph proposes a unified geometrical approach to dynamics of complex systems of various kinds engineering physical biophysical psychophysical sociophysical econophysical etc As their names suggest all these multi input multi output MIMO systems have something in common the underlying physics However instead of dealing with the popular soft complexity philosophy we rather propose a rigorous geometrical and topological approach We believe that our rigorous approach has much greater predictive power than the soft one We argue that science and technology is all about prediction and control Observation understanding and explanation are important in education at undergraduate level but after that it should be all prediction and control The main objective of this book is to show that high dimensional nonlinear systems and processes of real life can be modelled and analyzed using rigorous mathematics which enables their complete predictability and controllability as if they were linear systems It is well known that linear systems which are completely predictable and controllable by definition live only in Euclidean spaces of various dimensions They are as simple as possible mathematically elegant and fully elaborated from either scientific or engineering side However in nature nothing is linear In reality everything has a certain degree of nonlinearity which means unpredictability with subsequent uncontrollability

The Economic Philosophy of the Internet of Things James Juniper, 2018-06-27 To properly understand the nature of the digital economy we need to investigate the phenomenon of a ubiquitous computing system UCS As defined by Robin Milner this notion implies the following characteristics i it will continually make decisions hitherto made by us ii it will be vast maybe 100 times today's systems iii it must continually adapt on line to new requirements and iv individual UCSs will interact with one another This book argues that neoclassical approaches to modelling economic behaviour based on optimal control by representative agents are ill suited to a world typified by concurrency decentralized control and interaction To this end it argues for the development of new process based approaches to analysis modelling and simulation The book provides the context both philosophical and mathematical for the construction and application of new rigorous and meaningful analytical tools In terms of social theory it adopts a Post Cognitivist approach the elements of which include the nature philosophy of Schelling Marx's critique of political economy Peircean Pragmatism Whitehead's process philosophy and Merleau Ponty's phenomenology of the flesh along with cognitive scientific notions of embodied cognition and neural Darwinism as well as more questionable notions of artificial intelligence

that are encompassed by the rubric of perception and action without intelligence      *Processes, Terms and Cycles: Steps on the Road to Infinity* Aart Middeldorp, 2005-12-13 This Festschrift is dedicated to Jan Willem Klop on the occasion of his 60th birthday The volume comprises a total of 23 scientific papers by close friends and colleagues written specifically for this book The papers are different in nature some report on new research others have the character of a survey and again others are mainly expository Every contribution has been thoroughly refereed at least twice In many cases the first round of referee reports led to significant revision of the original paper which was again reviewed The articles especially focus upon the lambda calculus term rewriting and process algebra the fields to which Jan Willem Klop has made fundamental contributions

Robot 2023: Sixth Iberian Robotics Conference Lino Marques, Cristina Santos, José Luís Lima, Danilo Tardioli, Manuel Ferre, 2024-04-26 This text will be replaced by the correct backcover text information text as soon as we get it      **Topics in Hyperplane Arrangements** Marcelo Aguiar, Swapneel Mahajan, 2017-11-22 This monograph studies the interplay between various algebraic geometric and combinatorial aspects of real hyperplane arrangements It provides a careful organized and unified treatment of several recent developments in the field and brings forth many new ideas and results It has two parts each divided into eight chapters and five appendices with background material Part I gives a detailed discussion on faces flats chambers cones gallery intervals lunes and other geometric notions associated with arrangements The Tits monoid plays a central role Another important object is the category of lunes which generalizes the classical associative operad Also discussed are the descent and lune identities distance functions on chambers and the combinatorics of the braid arrangement and related examples Part II studies the structure and representation theory of the Tits algebra of an arrangement It gives a detailed analysis of idempotents and Peirce decompositions and connects them to the classical theory of Eulerian idempotents It introduces the space of Lie elements of an arrangement which generalizes the classical Lie operad This space is the last nonzero power of the radical of the Tits algebra It is also the socle of the left ideal of chambers and of the right ideal of Zie elements Zie elements generalize the classical Lie idempotents They include Dynkin elements associated to generic half spaces which generalize the classical Dynkin idempotent Another important object is the lune incidence algebra which marks the beginning of noncommutative M bius theory These ideas are also brought upon the study of the Solomon descent algebra The monograph is written with clarity and in sufficient detail to make it accessible to graduate students It can also serve as a useful reference to experts      **Picturing Quantum Processes** Bob Coecke, Aleks Kissinger, 2017-03-16 The unique features of the quantum world are explained in this book through the language of diagrams setting out an innovative visual method for presenting complex theories Requiring only basic mathematical literacy this book employs a unique formalism that builds an intuitive understanding of quantum features while eliminating the need for complex calculations This entirely diagrammatic presentation of quantum theory represents the culmination of ten years of research uniting classical techniques in linear algebra and Hilbert spaces with cutting edge developments in quantum

computation and foundations Written in an entertaining and user friendly style and including more than one hundred exercises this book is an ideal first course in quantum theory foundations and computation for students from undergraduate to PhD level as well as an opportunity for researchers from a broad range of fields from physics to biology linguistics and cognitive science to discover a new set of tools for studying processes and interaction      **Self-Evolvable Systems** Octavian Iordache,2012-07-05 This monograph presents key method to successfully manage the growing complexity of systems where conventional engineering and scientific methodologies and technologies based on learning and adaptability come to their limits and new ways are nowadays required The transition from adaptable to evolvable and finally to self evolvable systems is highlighted self properties such as self organization self configuration and self repairing are introduced and challenges and limitations of the self evolvable engineering systems are evaluated      **Mathematical Concepts** Jürgen Jost,2015-09-10 The main intention of this book is to describe and develop the conceptual structural and abstract thinking of mathematics Specific mathematical structures are used to illustrate the conceptual approach providing a deeper insight into mutual relationships and abstract common features These ideas are carefully motivated explained and illustrated by examples so that many of the more technical proofs can be omitted The book can therefore be used simply as an overview of the panorama of mathematical structures and the relations between them to be supplemented by more detailed texts whenever you want to acquire a working knowledge of some structure by itself as a first introduction to abstract mathematics together with existing textbooks to put their results into a more general perspective to gain a new and hopefully deeper perspective after having studied such textbooks Mathematical Concepts has a broader scope and is less detailed than standard mathematical textbooks so that the reader can readily grasp the essential concepts and ideas for individual needs It will be suitable for advanced mathematicians postgraduate students and for scientists from other fields with some background in formal reasoning      *Proceedings of the International Conference on Algebra 2010* Polly Wee Sy,2011 This volume is an outcome of the International Conference on Algebra in celebration of the 70th birthday of Professor Shum Kar Ping which was held in Gadjah Mada University on 7OC010 October 2010 As a consequence of the wide coverage of his research interest and work it presents 54 research papers all original and referred describing the latest research and development and addressing a variety of issues and methods in semigroups groups rings and modules lattices and Hopf Algebra The book also provides five well written expository survey articles which feature the structure of finite groups by A Ballester Bolinches R Esteban Romero and Yangming Li new results of GrAbner Shirshov basis by L A Bokut Yuqun Chen and K P Shum polygroups and their properties by B Davvaz main results on abstract characterizations of algebras of  $n$  place functions obtained in the last 40 years by Wieslaw A Dudek and Valentin S Trokhimenko Inverse semigroups and their generalizations by X M Ren and K P Shum Recent work on cones of metrics and combinatorics done by M M Deza et al is included      **Polystochastic Models for Complexity** Octavian Iordache,2010-03-20 Complexity understanding and management will be a main source of

efficiency and prosperity for the next decades and thus is of highest industrial and scientific interest This book on the latest in polystochastic models for complexity includes case studies

**Category Theory And Applications: A Textbook For Beginners (Second Edition)** Marco Grandis, 2021-03-05 Category Theory now permeates most of Mathematics large parts of theoretical Computer Science and parts of theoretical Physics Its unifying power brings together different branches and leads to a better understanding of their roots This book is addressed to students and researchers of these fields and can be used as a text for a first course in Category Theory It covers the basic tools like universal properties limits adjoint functors and monads These are presented in a concrete way starting from examples and exercises taken from elementary Algebra Lattice Theory and Topology then developing the theory together with new exercises and applications A reader should have some elementary knowledge of these three subjects or at least two of them in order to be able to follow the main examples appreciate the unifying power of the categorical approach and discover the subterranean links brought to light and formalised by this perspective Applications of Category Theory form a vast and differentiated domain This book wants to present the basic applications in Algebra and Topology with a choice of more advanced ones based on the interests of the author References are given for applications in many other fields In this second edition the book has been entirely reviewed adding many applications and exercises All non obvious exercises have now a solution or a reference in the case of an advanced topic solutions are now collected in the last chapter
