

1. Gas particles are spaced far apart relative to one another. Particles are moving with rapid, random motion.

2. Gases diffuse freely to fill the whole of the containing vessel. They can effuse through a tiny opening from a region of higher concentration to one of lower concentration.

3. Unlike solids and liquids, gases are readily compressible. The average distance between molecules is about 10 times the molecular diameter, so they can be easily pushed closer together.

4. When heated, gas particle motion becomes more active. This leads to an expansion of the gas. The higher the temperature, the more rapid is the gas molecule movement leading to an expansion.

Gas molecules colliding with the walls of a containing vessel exert a force over the surface area of the containing vessel, which results in a gas pressure.
