WHAT IS SUPERCONDUCTIVITY

- Superconductivity is a phenomenon of exactly zero electrical resistance and expulsion of magnetic flux fields occurring in certain materials, called **superconductors**, when cooled below a characteristic critical temperature(T_c).
- It was discovered by ***Dutch physicist H. Kamerlingh Onnes*** in **1911** .He won Nobel Prize for Physics in 1913 for his work on low-temperature physics and his production of liquid helium.

Mechanisms of High Temperature Superconductivity Hiroshi Kamimura,Atsushi Oshiyama,2013-03-07 Since the discovery by Bednorz and M ller of Cu O alloys displaying high temperature superconductivity great energy has been put into research in this field One of the most important and interesting issues and the subject of this volume is the clarification of the microscopic origin and mechanism of high temperature superconductivity This book discusses the latest experimental results on magnetic optical electrical thermal and mechanical properties of the Cu O and Bi O superconductors as well as proposed theoretical models of the mechanisms The participants in the symposium agreed that for the high Tc Cu O superconductors electron correlation effects are of central importance For the Bi O superconductors the main topic was whether the mechanism of superconductivity is the same as

that of high Tc Cu O superconductors What was and what was not resolved at the symposium is summarized at the end of the volume *Symmetry and Heterogeneity in High Temperature Superconductors* Antonio Bianconi, 2006 Advances in High Temperature Superconductors and their applications S. MOHAN, 2019-06-20 Prof Heike Kamerlingh Onnes discovered superconductivity while measuring resistivity of mercury Surprisingly the resistivity of mercury ceased at 4.2 K and this phenomenon was known as superconductivity He realized the importance of this discovery in producing large magnetic fields It was realized that superconductivity is in a new thermodynamic state with peculiar electric and magnetic properties This paved the way to discover more superconductors Simple elements such as Tin Indium or lead showed the highest critical temperature Tc 7.2 K They were called as Type I superconductors Niobium nitride was found to superconduct at 16 K at 1941 and Vanadium silicon showed superconductive properties at 17.5 K at 1953 Nb alloys and binary or more complex compounds such as Nb₃Sn Tc 18 K Nb Ti Tc 9 K Ga V with Tc 23 K became type II superconductors Thereafter there was not much improvement in the development of superconductor although wonderful applications were expected from superconductors After three decades Fullerenes like ceramic superconductors are discovered A decade ago MgB₂ was discovered with Tc 39 K These superconductors were routinely produced into forms of wires for producing larger magnetic fields In all these cases cooling was effectively done by liquid Helium A comprehensive microscopic theory of superconductivity in metals was proposed in 1957 by John Bardeen Leon Cooper and Robert Schrieffer the so called BCS theory for which they received the Nobel Prize in Physics In a major breakthrough George Bednorz and Karl Mueller discovered a brittle ceramic superconductivity in the family of cuprates at 30 K in 1986 and a new era began Inspired by the work of Bednorz and Mueller on high temperature superconductivity HTS Paul Chu and his associates at the University of Houston discovered in 1987 123 compounds That is YBCO Yttrium₁ Barium₂ Copper₃ Oxygen₇ and iso structural RBCO Rare earth₁ Barium₂ Copper₃ Oxygen₇ have a Tc of 93 K Prior to 1987 all superconducting materials had lower critical temperatures Tc's and therefore functioned only at temperatures near the boiling point of liquid helium 4.2 K or liquid hydrogen 20.28 K with the highest being Nb₃Ge at 23 K They were known as low temperature superconductors YBCO was the first material to become superconducting above 77 K boiling point of liquid nitrogen and subsequently a series of high temperature superconducting materials were discovered These superconducting materials are widely known as High temperature superconductors as these Tc's exceeded the limit prescribed by BCS theory HTSCs are potentially valuable as liquid nitrogen is cheaper than liquid helium YBCO possesses superior superconducting and physical properties YBCO receiver coils in NMR spectrometers have improved the resolution NMR spectrometers by a factor of 3 compared to that achievable with conventional coils Paul Chu's group holds the current Tc record of 164 K in the mercury barium based cuprate superconductor under pressure Their work led to a rapid succession of new high temperature superconducting materials ushering in a new era in material science chemistry and technology Added to this the structure of

Bi₂Sr₂Ca₂Cu₂O₁₀ BiSCCO high temperature superconductive compound having T_c 110 K was reported In 1993 mercuric cuprates perovskite ceramic superconductors with the transition temperatures T_c 138 K was also reported **Physical and Material Properties of High Temperature Superconductors** S. K. Malik, S. S. Shah, 1994 Physical Material Properties of High Temperature Superconductors Microstructure and Properties of High-Temperature Superconductors I. A. Parinov, 2007-09-06 This book provides a comprehensive presentation of all types of HTSC and includes a broad overview on HTSC computer simulations and modeling Especial attention is devoted to the Bi Sr Ca Cu O and Y Ba Cu O families that today are the most perspective for applications The book includes a great number of illustrations and references The monograph is addressed to students post graduate students and specialists taking part in the development preparation and researching of new materials Lectures On High Temperature Superconductivity Z Z Gan, Guo Zhen Yang, Z X Zhao, S S Xie, Rushan Han, 1991-10-31 The first part of these proceedings contains the invited lectures which aim to unify and summarize briefly the systematic knowledge and latest developments in the entire spectrum of high T_c superconductivity including the phenomenological and microscopic theory on HTS crystal structures and defects the fabrication of high T_c superconductors physical properties of HTSC tunneling junctions and electronics of HTSC etc The second part consists of the abstracts of all reports given at the seminar sessions High Temperature Superconductivity 2 Anant V.
