Physics and Materials Science of High Temperature Superconductors, IV R. Kossowsky, Miroslav Jelinek, Josef Novák, 2012-12-06 Five questions dominated the ARW on Physics and Materials Science of High Temperature Superconductors of which this book forms the permanent record Briefly these are i How close are we to a unified theory The consensus is that we are not ii Flux pinning can it be achieved in bulk materials Still an open question The following three questions are related iii Can grain boundary contributions be brought under control iv What is the real requirement for purity and general chemistry control v What is the practical outlook for bulk products tapes and wires One of the conclusions is that the geometry and dimensions in thin films are the key parameters

that facilitate the realization of high current densities and consequently their commercial application On the other hand the very large number of poorly understood microstructural chemical and mechanical variables involved in the preparation of bulk materials are currently prohibiting large scale commercialization of wires and tapes

Processing of High Temperature Superconductors Amit Goyal, Winnie Wong-Ng, Masato Murakami, Judith Driscoll, 2012-04-17 Included in this volume are papers on biaxial and triaxial crystallographic texturing epitaxial growth on biaxially textured substrates melt processing of YBCO and basic information about HTS materials concerning phase diagrams measurement of physical properties characterization and effects of various defects including grain boundaries on supercurrent transmission

Advances in Cryogenic Engineering Quan-Sheng Shu, Peter Kittel, David Glaister, John Hull, Bill Burt, Al Zeller, John Zbasnik, Vitalij Pecharsky, Steven W. Van Sciver, Ray Radebaugh, Michael DiPirro, J. Patrick Kelley, Klaus D. Timmerhaus, Jay Theilacker, Charles Reece, 2013-12-19 In recent years the technology of cryogenic comminution has been widely applied in the field of chemical engineering food making medicine production and particularly in recycling of waste materials Because of the increasing pollution of waste tires and the shortage of raw rubber resource the recycling process for waste rubber products has become important and commercially viable This technology has shown a great number of advantages such as causing no environmental pollution requiring low energy consumption and producing high quality products Hence the normal crusher which was used to reclaim materials such as waste tires nylon plastic and many polymer materials at atmospheric 12 temperature is being replaced by a cryogenic crusher In the cryogenic crusher the property of the milled material is usually very sensitive to temperature change When a crusher is in operation it will generate a great deal of heat that causes the material temperature increased Once the temperature increases over the vitrification temperature the material property will change and lose the brittle behavior causing the energy consumption to rise sharply Consequently the comminution process cannot be continued Therefore it is believed that the cryogenic crusher is the most critical component in the cryogenic comminution system The research on the temperature increase and energy consumption in the cryogenic crusher is not only

to reduce the energy consumption of the crasher but also to reduce the energy consumption of the cryogenic system
