**The Underlying Mechanisms and Novel Approaches for Diabetes and its Related Complications** Qi Pan,Lixin Guo,Chen Chen ,Solomon Tesfaye,2024-08-30 Diabetes mellitus is a chronic metabolic disease characterized by elevated blood glucose levels which severely affects the quality of life and survival of patients The latest data from the International Diabetes Federation showed that there are approximately 537 million diabetic patients globally in 2021 and it is expected to reach 783 million by 2045 The treatment

regime of diabetic patients mainly refers to the management of blood glucose and its complications. At present, typical hypoglycemic medications include insulin and non-insulin hypoglycemic drugs which can be subdivided into  $\alpha$ -glucosidase inhibitors, metformin, thiazolidinediones, sulfonylureas, glinides, DPP-4i, GLP-1RA and SGLT-2i. Diabetic patients with poor islet function usually require insulin replacement, but the majority of patients fail to meet ideal therapeutic targets with multiple hypoglycemic drug combinations including insulin. Furthermore, poor glycemic control is closely associated with an increased risk of diabetes complications, consequently an increased rate of mortality. More recently, promising new drugs and therapies emerged which have many other important benefits beyond glucose lowering. In addition, some traditional Chinese medicine have gradually revealed their therapeutic advantages. All of them provide more choices for the treatment of diabetes patients.

**Medicine in Chinese Cultures** Arthur Kleinman, 1974      **Advanced Technologies for the Quality Control and Standardization of Plant Based Medicines** Jiang Xu, Caroline Howard, 2020-06-18

Herbs and herbal products are of paramount importance for human health. To be able to guarantee safety and quality standards and testing methods are needed. Pharmacopoeias contain quality control protocols setting the standards which are then required by governments. The quality traits are many, including the intrinsic variables of medicinal plant, e.g. the levels of the active compounds and the absence of possibly naturally occurring toxic compounds. On the other hand, many quality traits are related to agricultural conditions and practices or to the harvesting and post-harvest processing. With so many variables, quality control of the end product becomes extremely complex, time consuming and costly. To ensure the quality of medicinal plants for human consumption, quality management, the use of good practices at each step from seed to final product, becomes a crucial aspect. In general, quality control includes the inspection of the product's identity, purity and content based on its physical, chemical or biological properties. To ensure the quality of herbal medications, criteria such as botanical quality, type of preparation, physical constants, adulteration, contaminants, chemical constituents, pesticide residues, etc. should be examined. Meanwhile, authentication of herbs is needed to avoid possible adulteration or contaminating plants, even toxic herbs such as *Aristolochia* species. Many of the methods are long standing, such as microscopy in combination with color reactions, but some 50 years ago chromatography developed as a major tool for both qualitative and quantitative analysis of herbal preparations. Nowadays, research is working on the improvement of these methods and on the development of novel tools. For instance, next generation sequencing and mass spectrometry imaging are emerging as new technologies for the quality control of herbal medicines. With these technologies, quick testing of herbal products and of mixed herbal powder preparations, including the testing for specific plant parts, botanical drugs, can be achieved. Also, novel chemical tools such as metabolomics and Near Infrared Red (NIR) spectroscopy are being developed as powerful tools to identify and to link these with activity by using chemometric tools such as multivariate analysis. Finally, progress of informatic tools such as machine learning helps to deal with the big data generated by sequencing or mass spectrometry. However, these new technologies like all other new-born technologies

should be tested and perfected for a broad range of products
