INSTRUMENTATION

previously proposed from indirect evidence (13, 14). By using fast thermolysis/FT-IR, we can readily detect both *cis*- and *trans*-HONO in the IR spectrum of the gas from RDX (see the PQR pair at 700–900 cm^{-1} in Figure 2). However, as shown in Figure 3, HONO is transient under the conditions of the experiment. The initial concentrations most closely reflect the connection of the gas products to the composition of the parent molecule.

Figure 4 shows the quantity of HONO as a percentage of the initial gas products for various nitramines (11) versus the H/NO₂ ratio in the parent molecule. The general trend suggests that HONO arises from adventitious bimolecular encounters of H and NO₂

radicals in the condensed phase (11) rather than from concerted decomposition of the 4- and 5-center intermediates (below) that may contribute in unimolecular gas-phase reactions (15).

Fast thermolysis/FT-IR thus far also has made key contributions to uncovering relationships between the parent molecular structure and decomposition

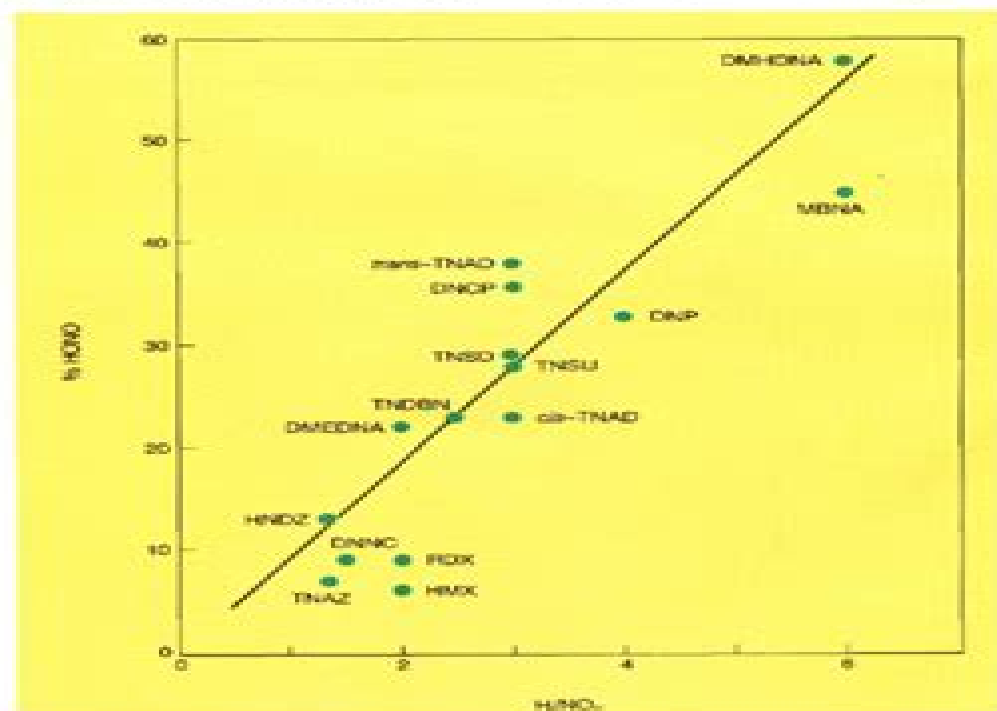

Figure 4. Plot of the initial relative percent concentration of HONO versus the H/NO₂ ratio in the parent molecule for a series of nitramine compounds.

Chemistry of Aquatic Systems: Local and Global Perspectives Giovanni Bidoglio,Werner Stumm,2013-11-08 Aquatic systems play a salient role in the complex processes of energy and matter exchange between the geosphere and the atmosphere For example reactions taking place in cloud water droplets can substantially alter the atmospheric budget and chemistry of trace gases pollution induced weathering reactions at water soil interfaces can affect the availability of nutrients and increase the concentration of potentially toxic metals in groundwaters Moreover the inextricable links between the water cycle the geosphere and the atmosphere ensure that apparently localized environmental problems have increasingly impacts in other parts of the world To identify local to global scale variables associated with environmental changes a focus must be placed on the recognition of processes rather than a continued reliance on monitoring state variables However in heterogeneous aquatic systems small scale aspects of a process under observation may not be summed directly to obtain regional estimates because of process nonlinearities with change in scale To understand this the integrated use of measurements across a range of scales is required
