Lactation Margaret Neville, 2013-11-11 This book had its genesis in the frustrations of the editors in locating authoritative up to date material for an interdisciplinary graduate course in mammary gland biology lactation and breast feeding As we turned to the original literature several reasons for the dearth of usable material became clear 1 In the areas of mammary gland biology and physiology particularly as they relate to the human reviews simply have not kept up with current research which has in the last two decades provided tremendous insight into the mechanisms of milk secretion and its control 2 The lack of interest in human milk as infant food inhibited researchers until very recently from investigating human lactation 3 Much of the relevant clinical information remains anecdotal with little scientific basis In this book we have tried to present the fundamentals of mammary gland physiology at the organismic and cellular levels in a form readily understood by physicians scientists and other professionals This basic information is accompanied by authoritative reviews of the nutritional and immunological properties of human milk and by clinically relevant chapters designed to help health care professionals deal with the medical problems of the breast feeding mother and her infant We have strived in these chapters for up to date authoritative but readable accounts In so far as possible we have avoided areas where much of our understanding rests on speculation In the clinical domain this was not always possible because of a lack of solid scientific information about breast feeding
