Equivariant K-Theory and Freeness of Group Actions on C*-Algebras N. Christopher Phillips,2006-11-15 Freeness of an action of a compact Lie group on a compact Hausdorff space is equivalent to a simple condition on the corresponding equivariant K theory This fact can be regarded as a theorem on actions on a commutative C algebra namely the algebra of continuous complex valued functions on the space The successes of noncommutative topology suggest that one should try to generalize this result to actions on arbitrary C algebras Lacking an appropriate definition of a free action on a C algebra one is led instead to the study of actions satisfying conditions on equivariant K theory in the cases of spaces simply freeness The first third of this book is a detailed exposition of equivariant K theory and KK theory assuming only a general knowledge of C algebras and some ordinary K theory It continues with the author s research on K theoretic freeness of actions It is shown that many properties of freeness generalize while others do not and that certain forms of K theoretic freeness are related to other noncommutative measures of freeness such as the Connes spectrum The implications of K theoretic freeness for actions on type I and AF algebras are also examined and in these cases K theoretic freeness is characterized analytically **The Universal Coefficient Theorem and Quantum Field Theory** Andrei-Tudor Patrascu,2016-09-23 This thesis describes a new connection between algebraic geometry topology number theory and quantum field theory It offers a pedagogical introduction to algebraic topology allowing readers to rapidly develop basic skills and it also presents original ideas to inspire new research in the quest for dualities Its ambitious goal is to construct a method based on the universal coefficient theorem for identifying new dualities connecting different domains of quantum field theory This thesis opens a new area of research in the domain of non perturbative physics one in which the use of different coefficient structures in co homology may lead to previously unknown connections between different regimes of quantum field theories The origin of dualities is an issue in fundamental physics that continues to puzzle the research community with unexpected results like the AdS CFT duality or the ER EPR conjecture This thesis analyzes these observations from a novel and original point of view mainly based on a fundamental connection between number theory and topology Beyond its scientific qualities it also offers a pedagogical introduction to advanced mathematics and its connection with physics This makes it a valuable resource for students in mathematical physics and researchers wanting to gain insights into co homology theories with coefficients or the way in which Grothendieck s work may be connected with physics **C^*-Algebras: 1943-1993** ,1994 **K-theory and Noncommutative Geometry** Guillermo Cortiñas,2008 Since its inception 50 years ago K theory has been a tool for understanding a wide ranging family of mathematical structures and their invariants topological spaces rings algebraic varieties and operator algebras are the dominant examples The invariants range from characteristic classes in cohomology

determinants of matrices Chow groups of varieties as well as traces and indices of elliptic operators Thus K theory is notable for its connections with other branches of mathematics Noncommutative geometry develops tools which allow one to think of noncommutative algebras in the same footing as commutative ones as algebras of functions on noncommutative spaces The algebras in question come from problems in various areas of mathematics and mathematical physics typical examples include algebras of pseudodifferential operators group algebras and other algebras arising from quantum field theory To study noncommutative geometric problems one considers invariants of the relevant noncommutative algebras These invariants include algebraic and topological K theory and also cyclic homology discovered independently by Alain Connes and Boris Tsygan which can be regarded both as a noncommutative version of de Rham cohomology and as an additive version of K theory There are primary and secondary Chern characters which pass from K theory to cyclic homology These characters are relevant both to noncommutative and commutative problems and have applications ranging from index theorems to the detection of singularities of commutative algebraic varieties The contributions to this volume represent this range of connections between K theory noncommmutative geometry and other branches of mathematics K-Theory for Operator Algebras Bruce Blackadar,2012-12-06 K Theory has revolutionized the study of operator algebras in the last few years As the primary component of the subject of noncommutative topol ogy K theory has opened vast new vistas within the structure theory of C algebras as well as leading to profound and unexpected applications of opera tor algebras to problems in geometry and topology As a result many topolo gists and operator algebraists have feverishly begun trying to learn each others subjects and it appears certain that these two branches of mathematics have become deeply and permanently intertwined Despite the fact that the whole subject is only about a decade old operator K theory has now reached a state of relative stability While there will undoubtedly be many more revolutionary developments and applications in the future it appears the basic theory has more or less reached a final form But because of the newness of the theory there has so far been no comprehensive treatment of the subject It is the ambitious goal of these notes to fill this gap We will develop the K theory of Banach algebras the theory of extensions of C algebras and the operator K theory of Kasparov from scratch to its most advanced aspects We will not treat applications in detail however we will outline the most striking of the applications to date in a section at the end as well as mentioning others at suitable points in the text Operator Algebras and Applications: Volume 1, Structure Theory; K-theory, Geometry and Topology David E. Evans,Masamichi Takesaki,1988 These volumes form an authoritative statement of the current state of research in Operator Algebras They consist of papers arising from a year long symposium held at the University of Warwick Contributors include many very well known figures in the field

Topics in Noncommutative Geometry Guillermo Cortiñas,2012 Luis Santalo Winter Schools are organized yearly by the Mathematics Department and the Santalo Mathematical Research Institute of the School of Exact and Natural Sciences of the University of Buenos Aires FCEN This volume contains the proceedings of the third Luis Santalo Winter School which

was devoted to noncommutative geometry and held at FCEN July 26 August 6 2010 Topics in this volume concern noncommutative geometry in a broad sense encompassing various mathematical and physical theories that incorporate geometric ideas to the study of noncommutative phenomena It explores connections with several areas including algebra analysis geometry topology and mathematical physics Bursztyn and Waldmann discuss the classification of star products of Poisson structures up to Morita equivalence Tsygan explains the connections between Kontsevich s formality theorem noncommutative calculus operads and index theory Hoefel presents a concrete elementary construction in operad theory Meyer introduces the subject of mathrm C algebraic crossed products Rosenberg introduces Kasparov s KK theory and noncommutative tori and includes a discussion of the Baum Connes conjecture for K theory of crossed products among other topics Lafont Ortiz and Sanchez Garcia carry out a concrete computation in connection with the Baum Connes conjecture Zuk presents some remarkable groups produced by finite automata Mesland discusses spectral triples and the Kasparov product in KK theory Trinchero explores the connections between Connes noncommutative geometry and quantum field theory Karoubi demonstrates a construction of twisted K theory by means of twisted bundles Tabuada surveys the theory of noncommutative motives **Triangulated Categories** Thorsten Holm,Peter Jørgensen,Raphaël Rouquier,2010-06-24 Over the last few decades triangulated categories have become increasingly important to the extent that they can now be viewed as a unifying theory underlying major parts of modern mathematics This 2010 collection of survey articles written by leading experts covers fundamental aspects of triangulated categories as well as applications in algebraic geometry representation theory commutative algebra microlocal analysis and algebraic topology These self contained articles are a useful introduction for graduate students entering the field and a valuable reference for experts **Equivariant E-Theory for C^*-Algebras** Erik Guentner,Nigel Higson,Jody Trout,2000 This title examines the equivariant e theory for c algebra focusing on research carried out by Higson and Kasparov Let A and B be C algebras which are equipped with continuous actions of a second countable locally compact group G We define a notion of equivariant asymptotic morphism and use it to define equivariant E theory groups EULG A B which generalize the E theory groups of Connes and Higson We develop the basic properties of equivariant E theory including a composition product and six term exact sequences in both variables and apply our theory to the problem of calculating K theory for group C algebras Our main theorem gives a simple criterion for the assembly map of Baum and Connes to be an isomorphism The result plays an important role in the work of Higson and Kasparov on the Bau m Connes conjecture for groups which act isometrically and metrically properly on Hilbert space

Operator Algebras Bruce Blackadar,2006-03-09 This volume attempts to give a comprehensive discussion of the theory of operator algebras C algebras and von Neumann algebras The volume is intended to serve two purposes to record the standard theory in the Encyc pedia of Mathematics and to serve as an introduction and standard reference for the specialized volumes in the series on current research topics in the subject Since there are already numerous excellent treatises on

various aspects of thesubject howdoesthisvolumemakeasigni cantadditiontotheliterature and how does it di er from the other books in the subject In short why another book on operator algebras The answer lies partly in the rst paragraph above More importantly no other single reference covers all or even almost all of the material in this volume I have tried to cover all of the main aspects of standard or clas cal operator algebra theory the goal has been to be well encyclopedic Of course in a subject as vast as this one authors must make highly subjective judgments as to what to include and what to omit as well as what level of detail to include and I have been guided as much by my own interests and prejudices as by the needs of the authors of the more specialized volumes *Mathematical Reviews* ,2004 *Functor Categories, Model Theory, Algebraic Analysis and Constructive Methods* Alexander Martsinkovsky,2024-05-04 This volume comprises selected contributions by the participants of the second Functor Categories Model Theory Algebraic Analysis and Constructive Methods conference which took place at the University of Almer a Spain in July 2022 The conference was devoted to several seemingly unrelated fields functor categories model theory of modules algebraic analysis including linear control systems and constructive category theory to mention just a few The fact that these fields are actually related is a very recent realization The connections between these disciplines are changing in real time and the goal of this volume is to provide an initial reference point for this emerging interdisciplinary field Besides research articles the volume includes two extended lectures one on constructive methods in algebraic analysis and the other on the functorial approach to algebraic systems theory Hence in addition to its interestfor researchers the volume will also be an invaluable resource for newcomers *Pacific Journal of Mathematics* ,1995 Mathematica Scandinavica ,2007 Report PM ,1988 *The Yokohama Mathematical Journal* ,1990 *Advances in Theoretical and Mathematical Physics* ,2008 **The C*-algebras of a Class of Solvable Lie Groups** Xiaolu Wang,1989 *Cumulative Book Index* ,1988 A world list of books in the English language
