Russell, 1990 This book describes how the testis is evaluated in research and toxicology testing settings It is resource for performing systematic evaluation of the testis      **Germ Cell Protocols** Heide Schatten, 2008-02-03 All sexually reproducing organisms produce primordial germ cells a small population of cells that differentiate into gametes of either sex and carry to potency an ability to develop into an entire new organism The study of germ cells has undergone enormous advances in recent years and has entered into an explosive phase of new discoveries with the introduction of transgenic technologies and nuclear cloning Basic knowledge and techniques developed for lower vertebrate and invertebrate systems have facilitated the study of higher vertebrates including humans Many experiments that have first been performed on lower vertebrates provided the tools and strategies that could later be applied to other less readily available mammalian systems The discovery of centrosomes in ascidians and sea urchin eggs now benefits studies of fertility and infertility in mammals External in vitro fertilization now a common technique in assisted fertilization has only been possible as a result of numerous studies in lower systems in which external fertilization is natural Egg activation first explored in sea urchin and ascidian eggs now benefits techniques designed to increase cloning efficiency in farm and domestic animals Gene manipulations and molecular methods have added to the possibilities of producing live offspring with enormous biomedical ecological and economic implications The two volumes on germ cells combine techniques in a variety of different systems we have selected those systems that have provided landmarks in advancing our knowledge on germ cells      **A Practical Guide to the Histology of the Mouse** Cheryl L. Scudamore, 2014-02-10 A Practical Guide to the Histology of the Mouse provides a full colour atlas of mouse histology Mouse models of disease are used extensively in biomedical research with many hundreds of new models being generated each year Complete phenotypic analysis of all of these models can benefit from histologic review of the tissues This book is aimed at veterinary and medical pathologists who are unfamiliar with mouse tissues and scientists who wish to evaluate their own mouse models It provides practical guidance on the collection sampling and analysis of mouse tissue samples in order to maximize the information that can be gained from these tissues As well as illustrating the normal microscopic anatomy of the mouse the book also describes and explains the common anatomic variations artefacts associated with tissue collection and background lesions to help the scientist to distinguish these changes from experimentally induced lesions This will be an essential bench side companion for researchers and practitioners looking for an accessible and well illustrated guide to mouse pathology Written by experienced pathologists and specifically tailored to the needs of scientists and histologists Full colour throughout Provides advice on sampling tissues necropsy and recording data Includes common anatomic variations background lesions and artefacts which will help non experts understand whether histologic variations seen are part of the normal background or related to their experimental

**Modulators of hypothalamic-pituitary-gonadal axis for the control of spermatogenesis and sperm quality in vertebrates** Gilda Cobellis, SILVIA FASANO, Riccardo Pierantoni, Rosaria Meccariello, 2014-12-01

Spermatogenesis is a process highly conserved throughout vertebrate species and is mainly under hypothalamic pituitary control It occurs in the testis in a stepwise fashion so that committed spermatogonia develop into spermatocytes and enter meiosis to produce round spermatids These undergo a morphological transformation spermiogenesis into mature spermatids i e spermatozoa which are differentially released from Sertoli cells spermiation depending on the species In mammals further transformations are necessary to form mature spermatozoa suitable for fertilization Gonadotropins mainly responsive to gonadotropin releasing hormone control spermatogenesis through specific receptors located at the gonadal level However besides the endocrine route the chemical mediators may also act locally in the gonad Indeed it is documented that testis physiology including steroidogenesis and spermatogenesis does not fully account for traditional endocrine control but an intragonadal network of autocrine and or paracrine regulators also exists whose activity via cell to cell communication regulates germ cell progression and development of qualitatively mature spermatozoa Of note a number of testicular modulators such as gonadotropin releasing hormone Kiss peptin endocannabinoids has been early isolated in the brain and latest in the gonads To fully understand precise mechanisms underlying the functional interaction of this intricate network needless to say it is crucially required to have detailed information about modulators and target cells Through synergy

between the respective specializations of all the authors this topic reviewed emerging knowledge about neuroendocrine and local mediators controlling germ cell progression and maturation *Oxygen Sensing* Sukhamay Lahiri, Gregg Semenza, Nanduri R. Prabhakar, 2003-04-15 Reviewing research on the molecular basis of oxygen homeostasis this text describes the changes in intracellular signalling and gene expression that lead to physiological responses to hypoxia in unicellular invertebrate and mammalian species It examines O<sub>2</sub> sensing systems in bacteria and archaea and demonstrates interrelationships among cell pr *Male Germline Stem Cells: Developmental and Regenerative Potential* Kyle E.
