mathematicians and researchers interested in geometry and arithmetic and their connections **Brauer Groups, Tamagawa Measures, and Rational Points on Algebraic Varieties** Jorg Jahnel, 2014-12-02 The central theme of this book is the study of rational points on algebraic varieties of Fano and intermediate type both in terms of when such points exist and if they do their quantitative density The book consists of three parts In the first part the author discusses the concept of a height and formulates Manin's conjecture on the asymptotics of rational points on Fano varieties The second part introduces the various versions of the Brauer group The author explains why a Brauer class may serve as an obstruction to weak approximation or even to the Hasse principle This part includes two sections devoted to explicit computations of the Brauer-Manin obstruction for particular types of cubic surfaces The final part describes numerical experiments related to the Manin conjecture that were carried out by the author together with Andreas Stephan Elsenhans The book presents the state of the art in computational arithmetic geometry for higher dimensional algebraic varieties and will be a valuable reference for researchers and graduate students interested in that area **Encyclopaedia of Mathematics** Michiel Hazewinkel, 2012-12-06 This is the second supplementary volume to Kluwer's highly acclaimed eleven volume Encyclopaedia of Mathematics This additional volume contains nearly 500 new entries written by experts and covers developments and topics not included in the previous volumes These entries are arranged alphabetically throughout and a detailed index is included This supplementary volume enhances the existing eleven volumes and together these twelve volumes represent the most authoritative comprehensive and up to date Encyclopaedia of Mathematics available **New Foundations for Geometry: Two Non-Additive Languages for Arithmetical Geometry** Shai M. J. Haran, 2017-02-20 To view the abstract go to <http://www.ams.org/books/memo/1166> *Algebraic Geometry In East Asia, Proceedings Of The Symposium* Kazuhiro Konno, Atsushi Moriawaki, Noboru Nakayama, Akira Ohbuchi, Sampei Usui, 2003-01-17 This book is the proceedings of the conference Algebraic Geometry in East Asia which was held in International Institute for Advanced Studies IIAS during August 3 to August 10 2001 As the breadth of the topics covered in this proceedings demonstrate the conference was indeed successful in assembling a wide spectrum of East Asian mathematicians and gave them a welcome chance to discuss current state of algebraic geometry **Proceedings of the Symposium on Algebraic Geometry in East Asia** Akira Ohbuchi, 2002 This book is the proceedings of the conference Algebraic Geometry in East Asia which was held in International Institute for Advanced Studies IIAS during August 3 to August 10 2001 As the breadth of the topics covered in this proceedings demonstrate the conference was indeed successful in assembling a wide spectrum of East Asian mathematicians and gave them a welcome chance to discuss current state of algebraic geometry Lectures on Algebraic Geometry II Günter Harder, 2011-04-21 This second volume introduces the concept of schemes reviews some commutative algebra and introduces projective schemes The finiteness theorem for coherent sheaves is proved here again the techniques of homological algebra and sheaf cohomology are needed In the last two chapters projective curves over an arbitrary ground

field are discussed the theory of Jacobians is developed and the existence of the Picard scheme is proved Finally the author gives some outlook into further developments for instance tale cohomology and states some fundamental theorems

The Universal Coefficient Theorem and Quantum Field Theory Andrei-Tudor Patrascu,2016-09-23 This thesis describes a new connection between algebraic geometry topology number theory and quantum field theory It offers a pedagogical introduction to algebraic topology allowing readers to rapidly develop basic skills and it also presents original ideas to inspire new research in the quest for dualities Its ambitious goal is to construct a method based on the universal coefficient theorem for identifying new dualities connecting different domains of quantum field theory This thesis opens a new area of research in the domain of non perturbative physics one in which the use of different coefficient structures in co homology may lead to previously unknown connections between different regimes of quantum field theories The origin of dualities is an issue in fundamental physics that continues to puzzle the research community with unexpected results like the AdS CFT duality or the ER EPR conjecture This thesis analyzes these observations from a novel and original point of view mainly based on a fundamental connection between number theory and topology Beyond its scientific qualities it also offers a pedagogical introduction to advanced mathematics and its connection with physics This makes it a valuable resource for students in mathematical physics and researchers wanting to gain insights into co homology theories with coefficients or the way in which Grothendieck s work may be connected with physics

Introduction to Modern Number Theory Yu. I. Manin,Alexei A. Panchishkin,2006-03-30 This edition has been called startlingly up to date and in this corrected second printing you can be sure that it s even more contemporaneous It surveys from a unified point of view both the modern state and the trends of continuing development in various branches of number theory Illuminated by elementary problems the central ideas of modern theories are laid bare Some topics covered include non Abelian generalizations of class field theory recursive computability and Diophantine equations zeta and L functions This substantially revised and expanded new edition contains several new sections such as Wiles proof of Fermat s Last Theorem and relevant techniques coming from a synthesis of various theories

Arakelov Geometry Atsushi Moriawaki,2014-11-05 The main goal of this book is to present the so called birational Arakelov geometry which can be viewed as an arithmetic analog of the classical birational geometry i e the study of big linear series on algebraic varieties After explaining classical results about the geometry of numbers the author starts with Arakelov geometry for arithmetic curves and continues with Arakelov geometry of arithmetic surfaces and higher dimensional varieties The book includes such fundamental results as arithmetic Hilbert Samuel formula arithmetic Nakai Moishezon criterion arithmetic Bogomolov inequality the existence of small sections the continuity of arithmetic volume function the Lang Bogomolov conjecture and so on In addition the author presents with full details the proof of Faltings Riemann Roch theorem Prerequisites for reading this book are the basic results of algebraic geometry and the language of schemes

Algebra Serge Lang,2012-12-06 From April 1999 Notices of the AMS announcing that the author was awarded

the Leroy P Steele Prize for Mathematical Exposition for his many mathematics books Lang's Algebra changed the way graduate algebra is taught retaining classical topics but introducing language and ways of thinking from category theory and homological algebra It has affected all subsequent graduate level algebra books From MathSciNet's review of the first edition The author has an impressive knack for presenting the important and interesting ideas of algebra in just the right way and he never gets bogged down in the dry formalism which pervades some parts of algebra This book is intended as a basic text for a one year course in Algebra at the graduate level or as a useful reference for mathematicians and professionals who use higher level algebra This book successfully addresses all of the basic concepts of algebra For the new edition the author has added exercises and made numerous corrections to the text

Arakelov Geometry and Diophantine Applications

Emmanuel Peyre, Gaël Rémond, 2021-03-10 Bridging the gap between novice and expert the aim of this book is to present in a self contained way a number of striking examples of current diophantine problems to which Arakelov geometry has been or may be applied Arakelov geometry can be seen as a link between algebraic geometry and diophantine geometry Based on lectures from a summer school for graduate students this volume consists of 12 different chapters each written by a different author The first chapters provide some background and introduction to the subject These are followed by a presentation of different applications to arithmetic geometry The final part describes the recent application of Arakelov geometry to Shimura varieties and the proof of an averaged version of Colmez's conjecture This book thus blends initiation to fundamental tools of Arakelov geometry with original material corresponding to current research This book will be particularly useful for graduate students and researchers interested in the connections between algebraic geometry and number theory The prerequisites are some knowledge of number theory and algebraic geometry
