Lecture Notes In International Trade Theory: Classical Trade And Applications Larry S Karp, 2021-12-08. Lecture Notes in International Trade Theory covers classical international trade models including the Ricardian, Ricardo, Viner, and Heckscher-Ohlin-Samuelson models. The course is designed for M.Sc. and first-year PhD students. It relies on both graphical and analytic methods requiring only intermediate microeconomics and a solid grounding in calculus. The material emphasizes second-best settings where markets are imperfect. The goal is to equip students with a good enough understanding of open economy general equilibrium relations that they understand how distortions ripple across different markets, e.g., commodity and factor markets. The Author applies these ideas to environmental and natural resource problems including pollution leakage where pollution reductions in one country are offset by trading partners' increased pollution and imperfect property rights. Other applications include the general equilibrium effects of commodity and trade taxes, international transfers, the transfer problem, minimum wage constraints, and immiserizing growth. The Author assumes that students have some experience in formulating and answering comparative statics questions in an optimization setting. Building on these skills and developing the idea of stability in an equilibrium setting, the Marshall-Lerner condition, students learn how to formulate and answer comparative static questions in trade models.

Environmental and Natural Resources Economics Steven C. Hackett, 2010-12-23. Extensively revised and updated, this popular text presents an accessible yet rigorous treatment of environmental and natural resources economics, including climate change and the economics of sustainability.
