Laser Measurement Technology Axel Donges, Reinhard Noll, 2014-10-14 Laser measurement technology has evolved in the last years in a versatile and reflationary way Today its methods are indispensable for research and development activities as well as for production technology Every physicist and engineer should therefore gain a working knowledge of laser measurement technology This book closes the gap of existing textbooks It introduces in a comprehensible presentation laser measurement technology in all its aspects Numerous figures graphs and tables allow for a fast access into the matter In the first part of the book the important physical and optical basics are described being necessary to understand laser measurement technology In the second part technically significant measuring methods are explained and application examples are presented Target groups of this textbook are students of natural and engineering sciences as well as working physicists and engineers who are interested to make themselves familiar with laser measurement technology and its fascinating potentials

Progress in Optical Fibers Research Zhijian Guo, 2007 This book presents new and important research on optical fibres An optical fibre is a glass or plastic fibre designed to guide light along its length by confining as much light as possible in a propagating form In fibres with large core diameter the confinement is based on total internal reflection In smaller diameter core fibres widely used for most communication links longer than 200 meters the confinement relies on establishing a waveguide Fibre optics is the overlap of applied science and engineering concerned with such optical fibres Optical fibres are widely used in fibre optic communication which permits transmission over longer distances and at higher data rates than other forms of wired and wireless communications They are also used to form sensors and in a variety of other applications The term optical fibre covers a range of different designs including graded index optical fibres step index optical fibres birefringent polarisation

maintaining fibres and more recently photonic crystal fibres with the design and the wavelength of the light propagating in the fiber dictating whether or not it will be multi mode optical fibre or single mode optical fibre Because of the mechanical properties of the more common glass optical fibres special methods of splicing fibres and of connecting them to other equipment are needed Manufacture of optical fibres is based on partially melting a chemically doped preform and pulling the flowing material on a draw tower Fibers are built into different kinds of cables depending on how they will be used
