Nanobrain Anirban Bandyopadhyay,2020-04-03 Making an artificial brain is not a part of artificial intelligence It will be a revolutionary journey of mankind exploring a science where one cannot write an equation a material will vibrate like geometric shape and then those shapes will change to make decisions Geometry of silence plays like a musical instrument to mimic a human brain our thoughts imagination everything would be a 3D shape playing as music composing music would be the brain s singular job For a century the Turing machine ruled human civilization it was believed that irrespective of complexity all events add up linearly This book is a thesis to explore the science of decision making where events are 3D geometric shapes events grow within and above never side by side The book documents inventions and discoveries in neuroscience computer science materials science mathematics and chemistry that explore the possibility of brain or universe as a time crystal The philosophy of Turing the philosophy of membrane based neuroscience and the philosophy of linear sequential thought process are challenged here by considering that a nested time crystal encompasses the entire conscious universe Instead of

an algorithm the pattern of maximum free will is generated mathematically and that very pattern is encoded in materials such that its natural vibration integrates random events exactly similar to the way nature does it in every remote corner of our universe Find how an artificial brain avoids any necessity for algorithm or programming using the pattern of free will

Hadron models and related New Energy issues Florentin Smarandache,V. Christianto,2007-01-01 The present book covers a wide range of issues from alternative hadron models to their likely implications to New Energy research including alternative interpretation of low energy reaction coldfusion phenomena The authors explored some new approaches to describe novel phenomena in particle physics M Pitkanen introduces his nuclear string hypothesis derived from his Topological Geometro dynamics theory while E Goldfain discusses a number of nonlinear dynamics methods including bifurcation pattern formation complex Ginzburg Landau equation to describe elementary particle masses Fu Yuhua discusses a plausible method for prediction of phenomena related to New Energy development F Smarandache discusses his unmatter hypothesis and A Yefremov et al discuss Yang Mills field from Quaternion Space Geometry Diego Rapoport discusses link between Torsion fields and Hadronic Mechanic A H Phillips discusses semiconductor nanodevices while V and A Boju discuss Digital Discrete and Combinatorial methods and their likely implications to New Energy research Pavel Pintr et al describe planetary orbit distance from modified Schrodinger equation and M Pereira discusses his new Hypergeometrical description of Standard Model of elementary particles The present volume will be suitable for researchers interested in New Energy issues in particular their link with alternative hadron models and interpretation While some of these discussions may be found a bit too theoretical our view is that once these phenomena can be put into rigorous theoretical framework thereafter more open minded physicists may be more ready to consider these New Energy methods more seriously Our basic proposition in the present book is that considering these new theoretical insights one can expect there are new methods to generate New Energy technologies which are clearly within reach of human knowledge in the coming years Advanced Mineralogy Arnold S. Marfunin,1994 This reference book is the third in a series of five volumes presenting a concise treatise on problems and final results of modern studies of earth and planetary materials in their most sophisticated aspects It is encyclopedic in its coverage of subjects which include the systematic description of all areas of mineral matter studies corresponding to the actual capabilities and needs of science and industry This third volume with contributions from 200 top specialists from all over the world contains chapters on Mineral Matter in Space Mineralogy of the Mantle and Core Mineralogy of the Ocean Floor Biomineralization Environmental Mineralogy Radiation Mineralogy and Gemology and Jewelry

Topological Geometrodynamics Matti Pitkanen, 2016-03-03 Topological geometrodynamics TGD is a modification of the theory of general relativity inspired by the problems related to the definition of inertial and gravitational energies in the earlier hypotheses TGD is also a generalization of super string models TGD brings forth an elegant theoretical projection of reality and builds upon the work by renowned scientists Wheeler Feynman Penrose Einstein Josephson to name a few In TGD Physical space time planes are visualized as four dimensional surfaces in a certain 8 dimensional space H The choice of H is fixed by symmetries of standard model and leads to a geometric mapping of known classical fields and elementary particle numbers TGD differs from Einstein's geometrodynamics in the way space time planes or sheets are lumped together Extending the theory based on fusing number concepts implies a further generalisation of the space time concept allowing the identification of space time correlates of cognition and intentionality Additionally zero energy ontology forces an extension of quantum measurement theory to a theory of consciousness and a hierarchy of phases is identified Dark matter is thus predicted with far reaching implications for the understanding of consciousness and living systems Therefore it sets a solid foundation for modeling our universe in geometric terms Topological Geometrodynamics An Overview explains basic and advanced concepts about TGD The book covers introductory information and classical TGD concepts before delving into twistor space theory particle physics infinite dimensional spinor geometry generalized number theory Planck constants and the applications of TGD theory in research The book is a valuable guide to TGD theory for researchers and advanced graduates in theoretical physics and cosmology

The Physical Nature of Consciousness Philip Van Loocke, 2001-04-12 The Physical Nature of Consciousness contains twelve chapters that discuss recent and new perspectives on the relation between modern physics and consciousness Stuart Hameroff opens with an extended and updated exposition of the Penrose Hameroff Orch OR model and subsequently addresses recent criticisms of quantum approaches to the brain Evan Walker presents his view on consciousness from the perspective of a new approach to the integration of quantum theory and relativity Friedrich Beck elaborates on the Beck Eccles quantum approach to

consciousness Karl Pribram puts the holographic view on consciousness in perspective of his life long work Peter Marcer and Edgar Mitchell explain the relevance of quantum holography for consciousness Gordon Globus discusses the relation between postmodern philosophical theories and quantum consciousness Chris Clarke develops a theory in terms of a specific type of formal logic to reconcile the phenomenology of consciousness with the physical world Ilya Prigogine summarizes his view on complexity and on the future of quantum theory which goes beyond the present formalism and goes on to comment on the problem of consciousness Matti Pitkanen identifies the place for consciousness in a unifying topological geometrodynamics theory Colin McGinn argues against classical materialism Dick Bierman gives an overview of anomalous phenomena He identifies a decline effect and discusses different possible interpretations Philip Van Loocke closes the volume with a discussion on how deep teleology in cellular systems may relate to consciousness
