*Chickadees and Titmice* Ken A. Otter, 2007-02-01 Chickadees and titmice are among the most popular birds in North America due in large part to their readiness to use bird feeders to nest in urban gardens and even to be trained to take food from people's hands. These attributes have also made them and their Eurasian tit counterparts perhaps the most intensively studied bird family in the world. Long term research in Europe has yielded some of the most comprehensive data on the impact of global warming on the breeding ecology of birds. Chickadees have amongst the best studied and most complex vocal behaviour of any bird species displaying one of the closest analogies to human sentence structure in the animal kingdom in their familiar chick-a-dee call. The social dominance hierarchies commonly witnessed in the form of squabbling at winter feeders are some of the most stable and closely studied and have huge impacts on controlling the lives of these small birds. Their food storing behavior and the brain and physiological mechanisms controlling this has contributed significantly to our wider understanding of spatial orientation. In recent years these birds have also been used as model species for investigating topics as diverse as inter species hybridization, the impacts of forest fragmentation and complex systems of communication. In short, chickadees and titmice have contributed enormously to our understanding of a myriad of topics in ecology, behavior and psychology. This book brings together a range of experts from across North America who utilise chickadees or titmice as study organisms. Each chapter reviews the latest advances in evolution and behavioral research that have been accomplished through the study of North American Parids and compares and contrasts this literature with research on their Eurasian counterparts as well as other avian families. This research level text is aimed at professional avian biologists and ornithologists as well as graduate students of avian behavioral ecology and evolution. It will also appeal to a more general audience of behavioural ecologists, neuroethologists and experimental psychologists.

**Forest Insect and Disease Conditions in Canada**, 1990 **Regenerating British Columbia's Forests** R. Parish, C. M. Johnson, G. Montgomery, A. Vyse, R. A. Willis, D. Winston, D. P. Lavender, 2011-11-01 Reforestation is a subject vital to the economy of British Columbia which depends heavily on its forests, a valuable but expendable resource. This book provides silviculturalists with a broad reference to the science and technology of reforestation in the Canadian province that forms the single most diverse forest region in North America. The work combines for the first time both experiences recorded from practical reforestation projects and the results of scientific investigations. The chapters of *Regenerating British Columbia's Forests* were compiled and reviewed by experts in each field of discussion. Topics include the physiological bases for seedling vigour and the interaction of reforestation with seedling physiology, the ecology of British Columbia's bioclimatic zones and the role of ecological site classification, the application of financial analyses to reforestation decisions, current technology in manual, mechanical and chemical site preparation and in the use of fire to prepare planting sites, recent progress in tree genetics and breeding and its relevance to the production of tree propagules, nursery technology, methodology in planting, evaluation, techniques of plantation release and the role of insects, disease and small mammals and birds in the reforestation process.

Regenerating British Columbia's Forests will assist those responsible for planning reforestation projects to reach informed decisions and will challenge them to consider primarily the biological factors basic to reforestation success rather than short term costs and production technology. Although its main audience is practising foresters and forestry students of British Columbia, the text will be of considerable interest to foresters in other parts of Canada, the United States and Europe who manage reforestation.

Pine Stem Rust Management Guidebook British Columbia. Ministry of Forests, 1996. This guide is designed to provide a reference for identifying, detecting, assessing and treating pine stem rusts in managed forest stands. The major rusts covered in the guide are western gall rust *Endocronartium harknessii*, Comandra blister rust *Cronartium comandrae*, stalactiform blister rust *C. coleosporoides*, sweet fern blister rust *C. comptoniae* and white pine blister rust *C. ribicola*. It gives keys to identification and information on rust behaviour and stand dynamics, rust management techniques and treatments and criteria used for assessing individual trees in a free growing survey of rust damage. The appendix contains a table indicating stem rust hazard and risk by British Columbia forest region and guidelines for pruning of white pine.
