Model-Driven Development of Reliable Automotive Services Manfred Broy, Ingolf Krüger, Michael Meisinger, 2008-07-17 Software development for the automotive domain has become the enabling technology for almost all safety critical and comfort functions offered to the customer Ninety percent of all innovations in automotive systems are directly or indirectly enabled by embedded software The numbers of serious accidents have declined in recent years despite constantly increasing traffic this is correlated with the introduction of advanced software enabled functionality for driver assistance such as electronic stability control Software contributes significantly to the automotive value chain By 2010 it is estimated that software will make up 40% of the value creation of automotive electronics However with the large number of software enabled functions their interactions and the corresponding

networking and operating infrastructure come significant complexities both during the automotive systems engineering process and at runtime. A central challenge for automotive systems development is the scattering of functionality across multiple subsystems such as electronic control units (ECUs) and the associated networks. As an example, consider the central locking systems (CLS) whose functionality is spread out over up to 19 different ECUs in some luxury cars. Of course, this includes advanced functionality such as seat positioning and radio tuning according to driver presets upon entry as well as unlocking in case of a detected impact or accident. However, this example demonstrates that modern automotive systems bridge comfort and safety-critical functionality. This induces particular demands on safety and security and, in general, software and systems quality. The resulting challenges and opportunities were discussed in depth at the second Automotive Software Workshop San Diego ASWSD 2006, on whose results we report here.

Fieldbus Systems and Their Applications 2001 (FeT'2001) International Federation of Automatic Control, 2002. This volume contains some 50 papers from the 4th IFAC conference on Fieldbus Systems and Their Applications FeT 2001 held in Nancy, France, 15-16 November 2001. This conference was for the first time sponsored by IFAC, with previous conferences being held in Vienna, Austria, in 1995 and 1997, and Magdeburg, Germany, in 1999. The programme covered a variety of research topics which are of current interest, such as performance, dependability of fieldbus-based systems, definition of device profiles and architectures, problems, conformance testing and interoperability, scheduling and new technologies, and wireless systems using formal methods and techniques. These papers came from academic and industrial authors from many countries, and the diversity of the points of view expressed led to an interesting conference rich in debates. Four plenary papers written by well-known specialists provide tutorial material as well as some history and background, and introduce more specialised content.
