Pasachoff,Alex Filippenko,2014 An exciting introduction to astronomy using recent discoveries and stunning photography to inspire non science majors about the Universe and science *Celestial Shadows* John Westfall,William Sheehan,2014-11-19 Much of what is known about the universe came from the study of celestial shadows This book looks in detail at the way eclipses and other celestial shadows have given us amazing insights into the nature of the objects in our solar system and how they are even helping us discover and analyze planets that orbit stars other than our Sun A variety of eclipses transits and occultations of the moons of Jupiter and Saturn Pluto and its satellite Charon asteroids and stars have helped astronomers to work out their dimensions structures and shapes even the existence of atmospheres and structures of exoplanets Long before Columbus set out to reach the Far East by sailing West the curved shadow of the Earth on the Moon during a lunar eclipse revealed that we inhabit a round world a globe More recently comparisons of the sunlit and Earthlit parts of the Moon have been used to determine changes in the Earth s brightness as a way of monitoring possible effects in cloud coverage which may be related to global warming Shadows were used by the Greek mathematician Eratosthenes to work out the first estimate of the circumference of the Earth by Galileo to measure the heights of the lunar mountains and by eighteenth century astronomers to determine the scale of the Solar System itself Some of the rarest and most wonderful shadows of all are those cast onto Earth by the lovely Evening Star Venus as it goes between the Earth and the Sun These majestic transits of Venus occur at most two in a century after the 2012 transit there is not a chance to observe this phenomenon until 2117 while the more common sweep of a total solar eclipse creates one of the most dramatic and awe inspiring events of nature Though it may have once been a source of consternation or dread solar eclipses now lead thousands of amateur astronomers and eclipse chasers to travel the globe in order to experience the dramatic view under totality These phenomena are among the most spectacular available to

The Complete Idiot's Guide to the Sun Jay M. Pasachoff,2003 No Marketing Blurb

The Sun Recorded Through History J.M. Vaquero,M. Vázquez,2009-04-21 The Sun is nowadays observed using different techniques that provide an almost instantaneous 3 D map of its structure Of particular interest is the study of the variability in the solar output produced by the dissipation of magnetic energy on different spatial and temporal scales the so called magnetic activity The 11 year cycle is the main feature describing this phenomenon Apart from its intrinsic scientific interest this topic is worth studying because of the interaction of such processes with the terrestrial environment A fleet of space and ground based observatories are currently monitoring the behaviour of our star on a daily basis However solar activity varies not only on this decadal time scale as has been attested mainly through two methods a records of the number of sunspots observed on the solar surface from 1610 and b the records of 14 10 cosmogenic isotopes such as ¹⁴C and ¹⁰Be measured in tree rings and ice cores respectively The study of the long term behaviour of solar activity may be complemented by the study of historical accounts describing phenomena directly or indirectly related to solar activity Numerous scientific and non scientific documents have reported these events and we can make use of them as a proxy of solar activity in past times
