Lectures In Parallel Computation Cambridge International Series On Parallel Computation:

Lectures in Parallel Computation Alan Gibbons, Paul Spirakis, 1993-03-18 The foundations of parallel computation especially the efficiency of computation are the concern of this book Distinguished international researchers have contributed fifteen chapters which together form a coherent stream taking the reader who has little prior knowledge of the field to a position of being familiar with leading edge issues The book may also function as a source of teaching material and reference for researchers The first part is devoted to the Parallel Random Access Machine P RAM model of parallel computation The initial chapters justify and define the model which is then used for the development of algorithm design in a variety of application areas such as deterministic algorithms randomisation and algorithm resilience The second part deals with distributed memory models of computation The question of efficiently implementing P RAM algorithms within these models is addressed as are the immensely interesting prospects for general purpose parallel computation **Parallel Scientific Computation** Rob H. Bisseling, 2020-09-30 Building upon the wide ranging success of the first edition Parallel Scientific Computation presents a single unified approach to using a range of parallel computers from a small desktop computer to a massively parallel computer The author explains how to use the bulk synchronous parallel BSP model to design and implement parallel algorithms in the areas of scientific computing and big data and provides a full treatment of core problems in these areas starting from a high level problem description via a sequential solution algorithm to a parallel solution algorithm and an actual parallel program written in BSPlib Every chapter of the book contains a theoretical section and a practical section presenting a parallel program and numerical experiments on a modern parallel computer to put the theoretical predictions and cost analysis to the test Every chapter also presents extensive bibliographical notes with additional discussions and pointers to relevant literature and numerous exercises which are suitable as graduate student projects The second edition provides new material relevant for big data science such as sorting and graph algorithms and it provides a BSP approach towards new hardware developments such as hierarchical architectures with both shared and distributed memory A single simple hybrid BSP system suffices to handle both types of parallelism efficiently and there is no need to master two systems as often happens in alternative approaches Furthermore the second edition brings all algorithms used up to date and it includes new material on high performance linear system solving by LU decomposition and improved data partitioning for sparse matrix computations The book is accompanied by a software package BSPedupack freely available online from the author's homepage which contains all programs of the book and a set of test driver programs This package written in C can be run using modern BSPlib implementations such as MulticoreBSP for C or BSPonMPI

Lectures in Parallel Computation Alan Gibbons, Paul Spirakis, 2005-07-21 This book contains collected lectures given at the 1990 ALCOM Spring School of Parallel Computation The motivation for the school was to provide an introduction for graduate students to topics at the leading edge of research in this very active area of computer science Topics covered

include PRAM algorithms general purpose computation systolic and distributed algorithms distributed memory models as well as issues from practical parallel computation The papers by some of the leading figures in this field have been carefully edited to make a coherent and unique introduction to the state of the art in concurrent computing **Euro-Par'96 -**

Parallel Processing Luc Bougé,1996-08-14 Content Description Includes bibliographical references and index *Models for Parallel and Distributed Computation* R. Correa,Ines de Castro Dutra,Mario Fiallos,Luiz Fernando Gomes da

Silva,2013-06-29 Parallel and distributed computation has been gaining a great lot of attention in the last decades During this period the advances attained in computing and communication technologies and the reduction in the costs of those technologies played a central role in the rapid growth of the interest in the use of parallel and distributed computation in a number of areas of engineering and sciences Many actual applications have been successfully implemented in various platforms varying from pure shared memory to totally distributed models passing through hybrid approaches such as distributed shared memory architectures Parallel and distributed computation differs from classical sequential computation in some of the following major aspects the number of processing units independent local clock for each unit the number of memory units and the programming model For representing this diversity and depending on what level we are looking at the problem researchers have proposed some models to abstract the main characteristics or parameters physical components or logical mechanisms of parallel computers The problem of establishing a suitable model is to find a reasonable trade off among simplicity power of expression and universality Then be able to study and analyze more precisely the behavior of parallel applications **Abstract Machine Models for Parallel and Distributed Computing** M. Kara,J. R. Davy,D. Goodeve,1996

Abstract Machine Models have played a profound though frequently unacknowledged role in the development of modern computing systems They provide a precise definition of vital concepts allow system complexity to be managed by providing appropriate views of the activity under consideration enable reasoning about the correctness and quantitative performance of proposed problem solutions and encourage communication through a common medium of expression Abstract Models in Parallel and Distributed computing have a particularly important role in the development of contemporary systems encapsulating and controlling an inherently high degree of complexity The Parallel and Distributed computing communities have traditionally considered themselves to be separate However there is a significant contemporary interest in both of these communities in a common hardware model a set of workstation class machines connected by a high performance network The traditional Parallel Distributed distinction therefore appears under threat Parallel Computation A. E. Fincham,Brian J. Ford,1993 This book came from a conference which surveyed the most recent research on numerical methods and the development of algorithms for use with parallel computers It is now widely accepted that parallel computing is the future the only way to achieve the processing speeds that are required to meet the needs of computer users in the future the software problems involved require the development of new solution algorithms which are capable of supporting many parallels The

emphasis of the conference was on the applications of parallel processing on the implementation of specific applications on parallel computers or with the development of efficient mathematical algorithms to be used in applications. The contributors include Mike Brady et al Oxford and Jeremy du Croz NAG UK *Euro-Par '96 - Parallel Processing* Luc Bouge, 1996-08-14
Content Description Includes bibliographical references and index **Mathematical Foundations of Computer Science 1994** Igor Privara, Branislav Rován, 1994-08-03 This volume constitutes the proceedings of the 19th International Symposium on Mathematical Foundations of Theoretical Computer Science MFCS 94 held in Kosice Slovakia in August 1994 MFCS 94 brought together specialists in theoretical fields of computer science from various countries in order to stimulate mathematical research in theoretical computer science. Besides 12 papers based on invited talks by renowned experts the book contains 42 research contributions selected from a total of 112 submissions. All areas of theoretical computer science are presented, some from a particular mathematical point of view *Architecture-Independent Loop Parallelisation* Radu C. Calinescu, 2012-12-06 Architecture independent programming and automatic parallelisation have long been regarded as two different means of alleviating the prohibitive costs of parallel software development. Building on recent advances in both areas, Architecture Independent Loop Parallelisation proposes a unified approach to the parallelisation of scientific computing code. This novel approach is based on the bulk synchronous parallel model of computation and succeeds in automatically generating parallel code that is architecture independent, scalable and of analytically predictable performance.

Fundamentals of Computation Theory Horst Reichel, 1995-08-16 This book presents the proceedings of the 10th International Conference on Fundamentals of Computation Theory FCT 95 held in Dresden Germany in August 1995. The volume contains five invited lectures and 32 revised papers carefully selected for presentation at FCT 95. A broad spectrum of theoretical computer science is covered among topics addressed are algorithms and data structures, automata and formal languages, categories and types, computability and complexity, computational logics, computational geometry, systems, specification, learning theory, parallelism and concurrency, rewriting and high level replacement systems, and semantics.

Specification of Parallel Algorithms Guy E. Blelloch, K. Mani Chandy, Suresh Jagannathan, 1994 This volume contains papers presented at the DIMACS workshop on Specification of Parallel Algorithms held in May 1994 at Princeton University. The goal of the workshop was to bring together some of the best researchers in parallel languages, algorithms, and systems to present and discuss recent developments in their areas of expertise. Among the topics discussed were new specification techniques for concurrent and distributed systems, behavioral and operational specification techniques, new parallel language and system abstractions, novel concurrent architectures and systems, large scale parallel systems, specification tools and environments, and proof techniques for concurrent systems *Tools and Environments for Parallel and Distributed Systems* Amr Zaky, Ted Lewis, 2012-12-06 Developing correct and efficient software is far more complex for parallel and distributed systems than it is for sequential processors. Some of the reasons for this added complexity are the lack of a universally

acceptable parallel and distributed programming paradigm the criticality of achieving high performance and the difficulty of writing correct parallel and distributed programs These factors collectively influence the current status of parallel and distributed software development tools efforts Tools and Environments for Parallel and Distributed Systems addresses the above issues by describing working tools and environments and gives a solid overview of some of the fundamental research being done worldwide Topics covered in this collection are mainstream program development tools performance prediction tools and studies debugging tools and research and nontraditional tools Audience Suitable as a secondary text for graduate level courses in software engineering and parallel and distributed systems and as a reference for researchers and practitioners in industry

Programming Languages: Implementations, Logics, and Programs Hugh Glaser, Peter Hartel, Herbert Kuchen, 1997-08-13 This volume constitutes the refereed proceedings of the 9th International Symposium on Programming Languages Implementations Logics and Programs PLILP 97 held in Southampton UK in September 1997 including a special track on Declarative Programming in Education The volume presents 25 revised full papers selected from 68 submissions Also included are one invited paper and three posters The papers are devoted to exploring the relation between implementation techniques the logic of the languages and the use of the languages in constructing real programs Topics of interest include implementation of declarative concepts integration of paradigms program analysis and transformation programming environments executable specifications reasoning about language constructs etc

Piecewise Regular Arrays Thomas P. Pals, 1999-02-22 Application specific regular array processors have been widely used in signal and image processing multimedia and communication systems for example in data compression and HDTV One of the main problems of application specific computing is how to map algorithms into hardware The major achievement of the theory of regular arrays is that an algorithm represented as a data dependence graph is embedded into a Euclidean space where the integer points are the elementary computations and the dependencies between computations are denoted by vectors between points The process of mapping an algorithm into hardware is reduced to finding for the given Euclidean space a new coordinate system that can be associated with the physical properties of space and time so called space time The power of the synthesis method is that it provides a bridge between abstract and physical representations of algorithms thus providing a methodological basis for synthesizing computations in space and in time This book will extend the existing synthesis theory by exploiting the associativity and commutativity of computations The practical upshot being a controlled increase in the dimensionality of the Euclidean space representing an algorithm This increase delivers more degrees of freedom in the choice of the space time mapping and leads subsequently to more choice in the selection of cost effective application specific designs
