Kingdon, 2012-12-06 A fundamental objective of Artificial Intelligence AI is the creation of intelligent computer programs In more modest terms AI is simply concerned with expanding the repertoire of computer applications into new domains and to new levels of efficiency The motivation for this effort comes from many sources At a practical level there is always a demand for achieving things in more efficient ways Equally there is the technical challenge of building programs that allow a machine to do something a machine has never done before Both of these desires are contained within AI and both provide the inspirational force behind its development In terms of satisfying both of these desires there can be no better example than machine learning Machines that can learn have an inbuilt efficiency The same software can be applied in many applications

and in many circumstances The machine can adapt its behaviour so as to meet the demands of new or changing environments without the need for costly re programming In addition a machine that can learn can be applied in new domains with the genuine potential for innovation In this sense a machine that can learn can be applied in areas where little is known about possible causal relationships and even in circumstances where causal relationships are judged not to exist This last aspect is of major significance when considering machine learning as applied to financial forecasting
