Abstract

Semagraph II is a working group (WG 6345) supported by the CEC basic research directorate. The main aim of Semagraph II has been to mature and promulgate the research results and prototypes developed during the Semagraph I Basic Research Action (BRA 3074). This note outlines the aims and achievements of Semagraph, and provides references to key results.

1 Introduction

At an Esprit technical workshop held late in 1987, a number of computational models were considered as a possible basis for a 'common virtual machine' to support European work on various programming languages and architectures, both conventional and novel (e.g. highly parallel). If a single computational model could be found which efficiently supported the various conventional and novel language paradigms, it could be the basis for common intermediate language and associated toolset, as well as a basis for reasoning about the behaviour and performance of hybrid systems built using many programming paradigms and realised on many architectures.

One conclusion from the workshop was that whilst no satisfactory common computational model was known, one based on graph rewriting might succeed. However, it was also noted that a considerable amount of foundational work was required even to establish the feasibility of such a model. Subsequent to the workshop, the Semagraph Basic Research Action (BRA 3074) was approved and ran from July 1989 to June 1992. One of its primary aims was to develop appropriate foundations for a graph rewriting model of computation.

Subsequently the CEC funded a follow-up activity in the form of a working group (WG6345) called Semagraph II, scheduled to run from October 1992 to September 1995. The central aim of Semagraph II is to mature and promulgate key results obtained from Semagraph I. This note briefly describes the aims, composition, activities and major results of Semagraph.

Theory and Practice of Model Transformations Antonio Vallecillo,Jeff Gray,Alfonso Pierantonio,2008-07-01 Models have become essential for dealing with the numerous aspects involved in developing and maintaining complex IT systems Models allow capturing of the relevant aspects of a system from a given perspective and at a precise level of abstraction In addition to models the transformations between them are other key elements in model driven engineering Model transformations allow the definition and implementation of the operations on models and also provide a chain that enables the automated development of a system from its corresponding models Furthermore model transformations may be realized using models and are therefore an integral part of any model driven approach There are already several proposals for model transformation specification implementation and execution which are beginning to be used by modeling practitioners However model transformations need specialized support in several aspects in order to realize their full potential The problem goes beyond having specific languages to represent model transformations we also need to understand their foundations such as the key concepts and operators supporting those languages their semantics and their structuring mechanisms and properties e.g modularity composability and parametrization In addition model transformations can be stored in repositories as reusable assets where they can be managed discovered and reused There is also a need to chain and combine model transformations in order to produce new and more powerful transformations and to be able to implement new operations on models Finally model transformations need methodology support i.e they need to be integrated into software development methodologies supported by appropriate tools and environments These issues and concerns define the focus of these proceedings
