**Environment, Development, and Evolution** Brian Keith Hall, Roy Douglas Pearson, Gerd B. Müller, 2004 Leading researchers in evolutionary developmental biology seek linkages between a synthesis of development physiology endocrinology ecology and evolution Evolutionary developmental biology also known as evo devo or EDB seeks to find links between development and evolution by opening the black box of development's role in evolution and in the evolution of developmental mechanisms In particular this volume emphasizes the roles of the environment and of hormonal signaling in evo devo It brings together a group of leading researchers to analyze the dynamic interaction of environmental factors with developmental and physiological processes and to examine how environmental signals are translated into phenotypic change from the molecular and cellular level to organisms and groups of organisms Taken together these chapters demonstrate the crucial roles of those processes of genetic developmental physiological and hormonal change that underpin evolutionary change in development morphology physiology behavior and life history Part I investigates links between environmental signals and developmental processes that could be preserved over evolutionary time Several contributors evaluate the work of the late Ryuichi Matsuda especially his emphasis on the role of the external environment in genetic change and variability pan environmentalism Other contributors in part I analyze different aspects of environmental genetic evolutionary linkages including the importance of alternate ontogenies in evolution and the paradox of stability over long periods of evolutionary time Part II examines the plasticity that characterizes much of development with contributors discussing such topics as gene regulatory networks and heterochronicity Part III analyzes the role of hormones and metamorphosis in the evolution of such organisms with alternate life history stages as lampreys amphibians and insects

**The Evolution of Feathers** Christian Foth, Oliver W. M. Rauhut, 2020-03-11 Feathers are one of the most unique characteristics of modern birds and represent the most complex and colourful type of skin derivate within vertebrates while also fulfilling various biological roles including flight thermal insulation display and sensory function For years it was generally assumed that the origin of flight was the main driving force for the evolution of feathers However various discoveries of dinosaur species with filamentous body coverings made over the past 20 years have fundamentally challenged this idea and produced new evolutionary scenarios for the origin of feathers This book is devoted to the origin and evolution of feathers and highlights the impact of palaeontology on this research field by reviewing a number of spectacular fossil discoveries that document the increasing morphological complexity along the evolutionary path to modern birds Also featuring chapters on fossil feather colours feather development and its genetic control the book offers a timely and comprehensive overview of this popular research topic
