Lectures In Theoretical Population Biology:

Lectures in Theoretical Population Biology Lev R. Ginzburg, Edward M. Golenberg, 1985 *Three Contributions to Theoretical Population Biology* Ralph McMillan Haygood, 2002 **Handbook of Statistical Genetics** David J. Balding, Martin Bishop, Chris Cannings, 2008-06-10 The Handbook for Statistical Genetics is widely regarded as the reference work in the field. However, the field has developed considerably over the past three years. In particular, the modeling of genetic networks has advanced considerably via the evolution of microarray analysis. As a consequence, the 3rd edition of the handbook contains a much expanded section on Network Modeling, including 5 new chapters covering metabolic networks, graphical modeling, and inference, and simulation of pedigrees and genealogies. Other chapters new to the 3rd edition include Human Population Genetics, Genome wide Association Studies, Family based Association Studies, Pharmacogenetics, Epigenetics, Ethic and Insurance. As with the second Edition, the Handbook includes a glossary of terms, acronyms, and abbreviations, and features extensive cross referencing between the chapters, tying the different areas together. With heavy use of up to date examples, real life case studies, and references to web based resources, this continues to be a must have reference in a vital area of research. Edited by the leading international authorities in the field, David Balding, Department of Epidemiology, Public Health, Imperial College, an advisor for our Probability Statistics series. Professor Balding is also a previous Wiley author, having written *Weight of Evidence for Forensic DNA Profiles*, as well as having edited the two previous editions of HSG. With over 20 years teaching experience, he has also had dozens of articles published in numerous international journals. Martin Bishop, Head of the Bioinformatics Division at the HGMP Resource Centre, as well as the first two editions of HSG. Dr Bishop has edited a number of introductory books on the application of informatics to molecular biology and genetics. He is the Associate Editor of the journal *Bioinformatics* and Managing Editor of *Briefings in Bioinformatics*. Chris Cannings, Division of Genomic Medicine, University of Sheffield. With over 40 years teaching in the area, Professor Cannings has published over 100 papers and is on the editorial board of many related journals. Co editor of the two previous editions of HSG, he also authored a book on this topic. **Handbook of Statistical Genomics** David J. Balding, Ida Moltke, John Marioni, 2019-07-02 A timely update of a highly popular handbook on statistical genomics. This new two volume edition of a classic text provides a thorough introduction to statistical genomics, a vital resource for advanced graduate students, early career researchers, and new entrants to the field. It introduces new and updated information on developments that have occurred since the 3rd edition. Widely regarded as the reference work in the field, it features new chapters focusing on statistical aspects of data generated by new sequencing technologies, including sequence based functional assays. It expands on previous coverage of the many processes between genotype and phenotype, including gene expression and epigenetics, as well as metabolomics. It also examines population genetics and evolutionary models, and inference, with new chapters on the multi species coalescent, admixture, and ancient DNA, as well as genetic association studies, including causal analyses, and

variant interpretation The Handbook of Statistical Genomics focuses on explaining the main ideas analysis methods and algorithms citing key recent and historic literature for further details and references It also includes a glossary of terms acronyms and abbreviations and features extensive cross referencing between chapters tying the different areas together With heavy use of up to date examples and references to web based resources this continues to be a must have reference in a vital area of research Provides much needed timely coverage of new developments in this expanding area of study Numerous brand new chapters for example covering bacterial genomics microbiome and metagenomics Detailed coverage of application areas with chapters on plant breeding conservation and forensic genetics Extensive coverage of human genetic epidemiology including ethical aspects Edited by one of the leading experts in the field along with rising stars as his co editors Chapter authors are world renowned experts in the field and newly emerging leaders The Handbook of Statistical Genomics is an excellent introductory text for advanced graduate students and early career researchers involved in statistical genetics

Biological Invasions: Theory and Practice Nanako Shigesada,Kohkichi Kawasaki,1997-02-06 This book deals with the ecological effect a species can have when it moves into an environment that it has not previously occupied commonly referred to as an Invasion It is unique in presenting a clear and accessible introduction to a highly complex area the modelling of biological invasions The book presents the latest theories and models developed from studies into this crucial area It includes data and examples from biological case studies showing how the models can be applied to the study of invasions whether dealing with AIDS the European rabbit or prickly pear cactuses In nature all organisms migrate or disperse to some extent either by walking swimming flying or being transported by wind or water When a species succeeds in colonising an area that it has not previously inhabited this is referred to as an invasion Humans can precipitate biological invasions often spreading disease or pests by their travels around the world Using the large amount of data that has been collected from studies worldwide ranging from pest control to epidemiology it has been possible to construct mathematical models that can predict which species will become an invader what kind of habitat is susceptible to invasion by a particular species and how fast an invasion will spread if it occurs This book presents a clear and accessible introduction to this highly complex area Included are data and examples from biological case studies showing how these models can be applied to the study of invasions whether dealing with AIDS the European rabbit or prickly pear cactuses [Index of NLM Serial Titles](#)

Metapopulation Dynamics: Empirical and Theoretical Investigations Michael Gilpin,2012-12-02 Metapopulation Dynamics Empirical and Theoretical Investigations covers the 1989 proceedings of a metapopulation dynamics workshop held at Lammi Biological Station Helsinki Finland It is divided into 18 chapters that cover various approaches to spatially structured population and community dynamics After briefly discussing the history of metapopulation ideas and the major conceptual links the book covers types of studies that have been conducted on single species and

multispecies metapopulations Then it examines the relationships between metapopulation dynamics the equilibrium theory of island biogeography and the dynamics of populations living in patchy environments It further tackles practical issues and the links between metapopulation dynamics and landscape ecology and between metapopulation dynamics and conservation biology Chapters 4 and 5 present structured models describing changes in the number of individuals within patches and an empirical evaluation of local extinction in metapopulation studies The subsequent chapters discuss several aspects of metapopulation including dispersal and connectivity colonization conspecific attraction extinction and isolation and forest fragmentation The latter chapters describe the concept of habitat fragmentation the diversity and competition in metapopulations the community collapse and the effects of metapopulation studies in predator prey systems **Ecological**

Time Series Thomas M. Powell, John H. Steele, 2012-12-06 This book results from a summer school held at Cornell University in 1992 The participants were graduate students and postdoctoral researchers selected from a broad range of interests and backgrounds in ecological studies The summer school was the second in a continuing series whose underlying aim and the aim of this volume is to bring together the different methods and concepts underpinning terrestrial freshwater and marine ecology The first volume in the series focused on patch dynamics in these three ecological sectors Here we have endeavored to complement that volume by extending its comparative approach to the consideration of ecological time series The types of data and the methods of collection are necessarily very different in these contrasting environments yet the underlying concept and the technical problems of analysis have much in common It proved to be of great interest and value to the summer school participants to see the differences and then work through to an appreciation of the generalizable concepts We believe that such an approach must have value as well for a much larger audience and we have structured this volume to provide a comparable reading experience **Structured-Population Models in Marine, Terrestrial, and Freshwater**

Systems Shripad Tuljapurkar, Hal Caswell, 2012-12-06 In the summer of 1993 twenty six graduate and postdoctoral students and fourteen lecturers converged on Cornell University for a summer school devoted to structured population models This school was one of a series to address concepts cutting across the traditional boundaries separating terrestrial marine and freshwater ecology Earlier schools resulted in the books Patch Dynamics S A Levin T M Powell a book on food webs is in preparation Models of population structure differences among individuals due to age size developmental stage spatial location or genotype have an important place in studies of all three kinds of ecosystem In choosing the participants and lecturers for the school we selected for diversity biologists who knew some mathematics and mathematicians who knew some biology field biologists sobered by encounters with messy data and theoreticians intoxicated by the elegance of the underlying mathematics people concerned with long term evolutionary problems and people concerned with the acute crises of conservation biology For four weeks these perspectives swirled in discussions that started in the lecture hall and carried on into the sweltering Ithaca night Diversity may or may not increase stability but it surely makes things interesting

Handbook of Game Theory with Economic Applications R.J. Aumann, S. Hart, 1992 This is the second of three volumes surveying the state of the art in Game Theory and its applications to many and varied fields in particular to economics The chapters in the present volume are contributed by outstanding authorities and provide comprehensive coverage and precise statements of the main results in each area The applications include empirical evidence The following topics are covered communication and correlated equilibria coalitional games and coalition structures utility and subjective probability common knowledge bargaining zero sum games differential games and applications of game theory to signalling moral hazard search evolutionary biology international relations voting procedures social choice public economics politics and cost allocation This handbook will be of interest to scholars in economics political science psychology mathematics and biology For more information on the Handbooks in Economics series please see our home page on <http://www.elsevier.nl/locate/hes>

Phylogenetic Inference, Selection Theory, and History of Science Rasmus Grønfeldt Winther, 2018-07-19 A W F Edwards is one of the most influential mathematical geneticists in the history of the discipline One of the last students of R A Fisher Edwards pioneered the statistical analysis of phylogeny in collaboration with L L Cavalli Sforza and helped establish Fisher's concept of likelihood as a standard of statistical and scientific inference In this book edited by philosopher of science Rasmus Grønfeldt Winther Edwards's key papers are assembled alongside commentaries by leading scientists discussing Edwards's influence on their own research and on thinking in their field overall In an extensive interview with Winther Edwards offers his thoughts on his contributions their legacy and the context in which they emerged This book is a resource both for anyone interested in the history and philosophy of genetics statistics and science and for scientists seeking to develop new algorithmic and statistical methods for understanding the genetic relationships between and among species both extant and extinct

Arino, David E Axelrod, Marek Kimmel, 1997-12-04 This book presents a new approach to the subject of cosmology It fully exploits Einstein's theory of general relativity It is found that the most general formal expression of the theory replaces the 10 component tensor formalism with a 16 component quaternion formalism This leads to a unified field theory where one field incorporates gravitation and electromagnetism The theory predicts an oscillating universe cosmology with a spiral configuration Dark matter is explained in terms of a sea of particle antiparticle pairs each in a particular derived ground state This leads to an explanation for the separation between matter and antimatter in the universe There is a brief

discussion of black holes and pulsars The final chapter delves into philosophical considerations such as the different types of truth positivism versus realism and a discussion of the role of the Mach principle in physics and cosmology a **Games of Life** Karl Sigmund,2017-08-21 Accessible informative and enjoyable treatment discusses the application of the ideas and methods of game theory and mathematical modeling to such areas as evolution sex animal behavior and aggression Excellent Nature **Patch Dynamics** Simon A. Levin,Thomas M. Powell,John H. Steele,2012-12-06 From the preface by Joel E Cohen A century from now humanity will live in a managed or mismanaged global garden We are debating the need to preserve tropical forests Farming of the sea is providing an increasing part of our fish supply We are beginning to control atmospheric emissions In 100 years we shall use novel farming practices and genetic engineering of bacteria to manipulate the methane production of rice fields The continental shelf will be providing food energy possibly even living space To make such intensive management possible will require massive improvements in data collection and analysis and especially in our concepts A century hence we will live on a wired earth the oceans and the crust of the earth will receive the same comprehensive monitoring now devoted to weather As the peoples of currently developing countries increase their levels of wealth the need for global management will become irresistible as impatience with the accidents of nature and intolerance of mismanagement of the environment especially of living resources grow Our control of physical perturbations and chemical inputs to the environment will be judged by the consequences to living organisms and biological communities How can we obtain the factual and theoretical foundation needed to move from our present fragmented knowledge and limited abilities to a managed global garden This problem was addressed in the lectures and workshops of a summer school on patch dynamics at Cornell University The school emphasized the analysis and interpretation of spatial patterns in terrestrial and marine environments This book contains the course material of this school combining general reviews with specific applications

Animal Groups in Three Dimensions Julia K. Parrish,William Hamner,William M. Hamner,1997-12-13 The first attempt to investigate this pervasive biological phenomenon from a variety of disciplines from physics to mathematics to biology

Stage-Structured Populations Bryan Manly,2013-03-09 This book provides a review of methods for obtaining and analysing data from stage structured biological populations The topics covered are sampling designs Chapter 2 the estimation of parameters by maximum likelihood Chapter 3 the analysis of sample counts of the numbers of individuals in different stages at different times Chapters 4 and 5 the analysis of data using Leslie matrix types of model Chapter 6 and key factor analysis Chapter 7 There is also some discussion of the approaches to modelling and estimation that have been used in five studies of particular populations Chapter 8 There is a large literature on the modelling of biological populations and a multitude of different approaches have been used in this area The various approaches can be classified in different ways Southwood 1978 ch 12 but for the purposes of this book it is convenient to think of the three categories mathematical statistical and predictive modelling Mathematical modelling is concerned largely with developing models that capture the

most important qualitative features of population dynamics In this case the models that are developed do not have to be compared with data from natural populations As representations of idealized systems they can be quite informative in showing the effects of changing parameters indicating what factors are most important in promoting stability and so on

Control and Game-Theoretic Models of the Environment Jerzy Filar, Carlo Carraro, 2012-12-06 This book collects some recent works on the application of dynamic game and control theory to the analysis of environmental problems This collection of papers is not the outcome of a conference or of a workshop It is rather the result of a careful screening from among a number of contributions that we have solicited across the world In particular we have been able to attract the work of some of the most prominent scholars in the field of dynamic analyses of the environment Engineers mathematicians and economists provide their views and analytical tools to better interpret the interactions between economic and environmental phenomena thus achieving through this interdisciplinary effort new and interesting results The goal of the book is more normative than descriptive All papers include careful modelling of the dynamics of the main variables involved in the game between nature and economic agents and among economic agents themselves as well described in Vrieze's introductory chapter Furthermore all papers use this careful modelling framework to provide policy prescriptions to the public agencies authorized to regulate emission dynamics Several diverse problems are addressed from global issues such as the greenhouse effect or deforestation to international ones such as the management of fisheries to local ones for example the control of effluent discharges Moreover pollution problems are not the only concern of this book
